

Single channel buffer/driver

SN74LVC1G07

Product Data Sheet

**AOTE DCC
RELEASE**

◆ Summary :

SN74LVC1G07 is a single channel buffer and driver that can operate within a supply voltage range of 1.65V to 5.5V. The SN74LVC1G07 device belongs to the open drain output type and can be connected to other open drain output terminals to achieve low-level effective line or (OR) or high-level effective line and (AND) functions. This device can be used for Loff local power outage applications. When the device is powered off, the loff circuit will disable the output to prevent backflow current from causing damage to the device.

The device is packaged in SOT23-5 and SC70-5. The working temperature range is from -40°C to +125°C.

◆ Product features

- Small Package: SOT23-5、SC70-5
- Working voltage range: 2.0V~5.5V
- Low power consumption: 0.1μA (typical value)
- Working temperature range: -40°C~+125°C
- Input leakage and open leakage output voltage up to 5.5V
- High Output driver: When powered by 3.0V, output driver ± 24 mA

◆ Applications

- Blu ray player and home theater
- Desktop or laptop computer
- Digital Video Camera (DVC)
- mobile phone
- Personal Navigation Device (GPS)
- Portable media player

◆ **ESD level**

The following ESD information is only applicable to sensitive equipment operated within an ti-static protection zones

–	nominal value	Unit	 ESD sensitivity warning The scope of ESD damage can range from minor performance degradation to complete equipment failure. Precision integrated circuits may be more susceptible to damage as very small parameter changes can result in devices not meeting their published parameter specifications.

Charged Device Model (CDM)	±1000		
Mechanical Model (MM)	±200		

Attention:

- (1) This only represents the limit values obtained by the product under testing conditions, and does not mean that the product can work normally under these conditions or other parameter conditions beyond the specifications. Exceeding the range specified by the absolute maximum rated value above will cause damage to the product, and it is impossible to predict the working state of the product outside of the above conditions. If the product operates under conditions other than those mentioned above for a long time, it may affect its performance.
- (2) If the input and output current ratings are followed, it may exceed the input and output negative voltage ratings.
- (3) The value of VCC is provided in the recommended working condition table.
- (4) The thermal impedance of the package is calculated according to JE5D-51 standard:
- (5) The maximum power consumption is a function of $T_{J(MAX)}$, $R\theta_{JA}$, and T_A . The maximum power consumption at any ambient temperature is $P_o = (T_{J(MAX)} - T_A) / R\theta_{JA}$, which is suitable for packaging directly soldered to PCB.
