

**Single pole double throw
analog switch**

SN74LVC1G3157

Product Data Sheet

**AOTE DCC
RELEASE**

◆ Summary :

SN74LVC1G3157 is a single pole double throw (SPDT) analog switch with a working voltage range of 1.8V to 5.5V.

SN74LVC1G3157 is capable of processing both analog and digital signals, and has the characteristics of high bandwidth (300MHz) and low conductivity (typical value of 4.5Q). The application areas include signal switching, modulation or demodulation (modems), and the role of a multiplexer in analog-to-digital and digital to analog conversion systems.

◆ Product features

- Package: SOT23-6、SC70-6
- High bandwidth: 300MHz
- Working voltage range: +1.8V~+5.5V
- Low on resistance, 4.5 Ω (typical value)
- Turn off and then turn on the switch
- TTL/CMOS compatible
- Working temperature range: -40°C~+125°C
- ESD protection exceeding JESD 22 standard
 - 1000-V human model
 - 100-V Mechanical Model (A115)
 - 1000-V Charged Device Model (JS-002)

◆ Applications

- Wearable devices
- Battery powered equipment
- Signal switching, chopping, modulation or demodulation
- Portable computer
- Mobile phone

◆ **ESD level**

The following ESD information is only applicable to sensitive equipment operated within an ti-static protection zones

-	nominal value	Unit	 ESD sensitivity warning
human model	±1000	V	The scope of ESD damage can range from minor performance degradation to complete equipment failure. Precision integrated circuits may be more susceptible to damage as very small parameter changes can result in devices not meeting their published parameter specifications.
Charged Device Model	±1000		
Mechanical Model	±100		

Attention:

- (1) This only represents the limit values obtained by the product under testing conditions, and does not mean that the product can work normally under these conditions or other parameter conditions beyond the specifications. Exceeding the range specified by the absolute maximum rated value above will cause damage to the product, and it is impossible to predict the working state of the product outside of the above conditions. If the product operates under conditions other than those mentioned above for a long time, it may affect its performance.
- (2) If the input/output clamp current value meets the rated value, it is allowed to exceed the rated value of the input/output negative voltage.
- (3) The thermal impedance of the package is calculated according to JESD-51 standard:
- (4) The maximum power consumption is a function of T_J (MAX), R θ_{JA}, and T_A. The maximum power consumption at any ambient temperature is $P_o = (T_J (MAX) - T_A) / R \theta_{JA}$, which is suitable for packaging directly soldered to PCB.

(1) All unused input ports of the device must be kept at VCC or GND to ensure proper operation of the device.

(2) The limit value is 100% production testing conducted at 25°C. Ensure the limitation of the working temperature range by utilizing the correlation of statistical quality control (SQC) methods.

(3) Typical values represent the most likely parameter specifications determined during characterization. The actual typical values may vary over time and will also depend on the application and configuration.
