

**Slit Adhesive Sleeve
(S-1124)**

This specification covers the requirements for one type of single wall extruded adhesive. It shall be homogenous and essentially free from flaws, defects, pinholes, seams, cracks or inclusions.

Note 1: Adhesive Peel Strength

Polvolefin

Shrink a 6-inch length of size 1-1/2 inch Thermofit NT-FR* on a glass-laminated plastic or metal tube, 1 inch in diameter, and approximately 1 foot long, with a Thermofit Model 500B Thermogun* or equivalent. Cool to room temperature, lightly abrade with No. 320 emery cloth, and wipe with MEK. Spiral wrap S-1124⁺ tape on the recovered tubing, with a 50% overlap. Place a strip of 3/4-inch-wide masking tape lengthwise on the adhesive tape to hold it in place and to provide unbonded ends to insert into the tensile tester.

Abrade and clean the inside surface of three 1-1/2 inch lengths of size 1-1/2 inch NT-FR. Place them on the prepared mandrel so that they are about 1/2 inch apart, and shrink with the Thermogun. Place the assembly in an oven for 10 minutes at $150 \pm 3^{\circ}\text{C}$ ($302 \pm 5^{\circ}\text{F}$).

Cool to room temperature, and cut along one edge of the masking tape to remove the bonded assembly from the mandrel. Cut a 1-inch wide specimen from the center of each double thickness. Insert the unbonded ends in a tensile tester operating at 2 inches per minute. Make readings of peel strength at every 1/2 inch of jaw separation after 1 inch initial separation. The average of 5 readings shall define peel strength.
