

Over-Voltage Protection Load Switch with Surge Protection

Features

- Highly reliable FCQFN 1.3mm×1.8mm-12L package
- Surge protection
 - IEC 61000-4-5: > 100V
- Integrated low R_{dson} nFET switch: typical 27mΩ
- 5A continuous current capability
- Default Over-Voltage Protection threshold: 6.8V
- OVP threshold adjustable range: 4V to 24V
- Input system ESD protection
 - IEC 61000-4-2 Contact discharge: ±8kV
 - IEC 61000-4-2 Air gap discharge: ±15kV
- Input maximum voltage rating: 29V_{DC}
- Fast turn-off response: typical 100ns
- Over-Temperature Protection (OTP)
- Under-Voltage Lockout (UVLO)

Applications

- Smartphones
- Tablets
- Charging Ports

General Description

The AW32915 OVP load switch features surge protection, an internal clamp circuit protects the device from surge voltages up to 100V.

The AW32915 features an ultra-low 27mΩ (typ.) R_{dson} nFET load switch. When input voltage exceeds the OVP threshold, the switch is turned off very fast to prevent damage to the protected downstream devices. The IN pin is capable of withstanding fault voltages up to 29V_{DC}.

The default OVP threshold is 6.8V (AW32915), the OVP threshold can be adjusted from 4V to 24V through external OVLO pin.

The device features an open-drain output $\overline{\text{ACOK}}$, when $V_{\text{IN_UVLO}} < V_{\text{IN}} < V_{\text{IN_OVLO}}$ and the switch is on, $\overline{\text{ACOK}}$ will be driven low to indicate a good power input, otherwise it is high impedance.

This device features over-temperature protection that prevents itself from thermal damaging.

Typical Application Circuit

Figure 1 AW32915 Typical Application Circuit

R_1 and R_2 are used for OVP threshold adjustment, to use default OVP threshold, connect OVLO to ground.

Pin Configuration and Top Mark

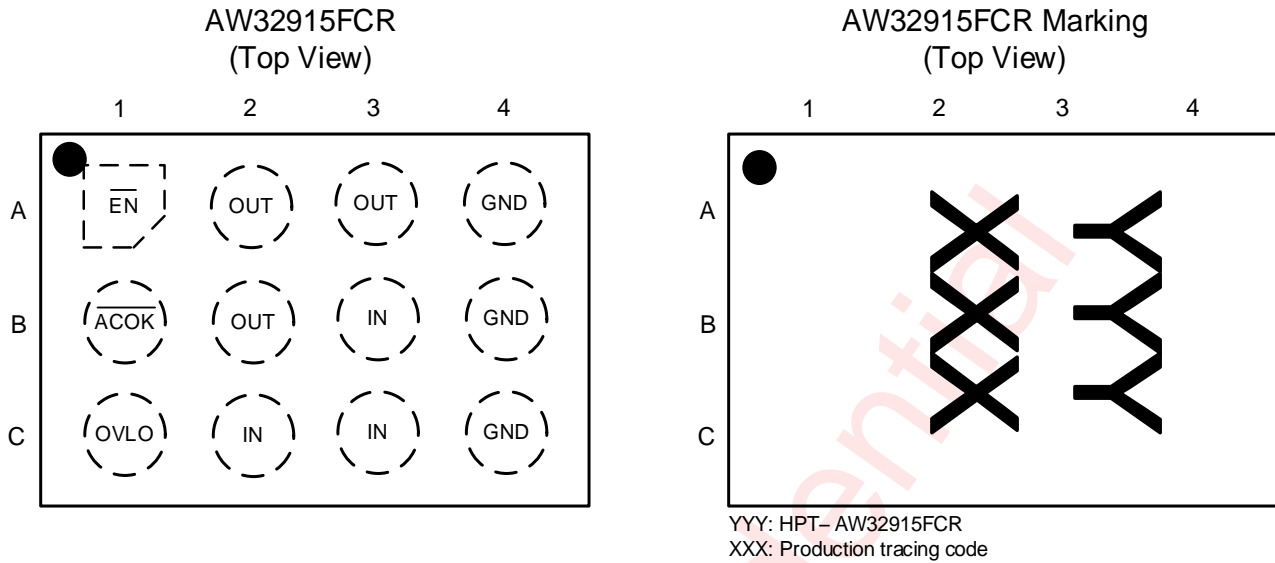

Figure 2 Pin Configuration and Top Mark

Pin Definition

Pin	Name	Description
A1	$\overline{\text{EN}}$	Enable pin, active low
B1	$\overline{\text{ACOK}}$	Power good flag, active-low, open-drain output. When $V_{\text{IN_UVLO}} < V_{\text{IN}} < V_{\text{IN_OVLO}}$, $\overline{\text{ACOK}}$ is pulled low, otherwise it's hi-Z state
C1	OVLO	OVP threshold adjustment pin
C2, C3, B3	IN	Switch input and device power supply
A2, A3, B2	OUT	Switch output
A4, B4, C4	GND	Device ground

Functional Block Diagram

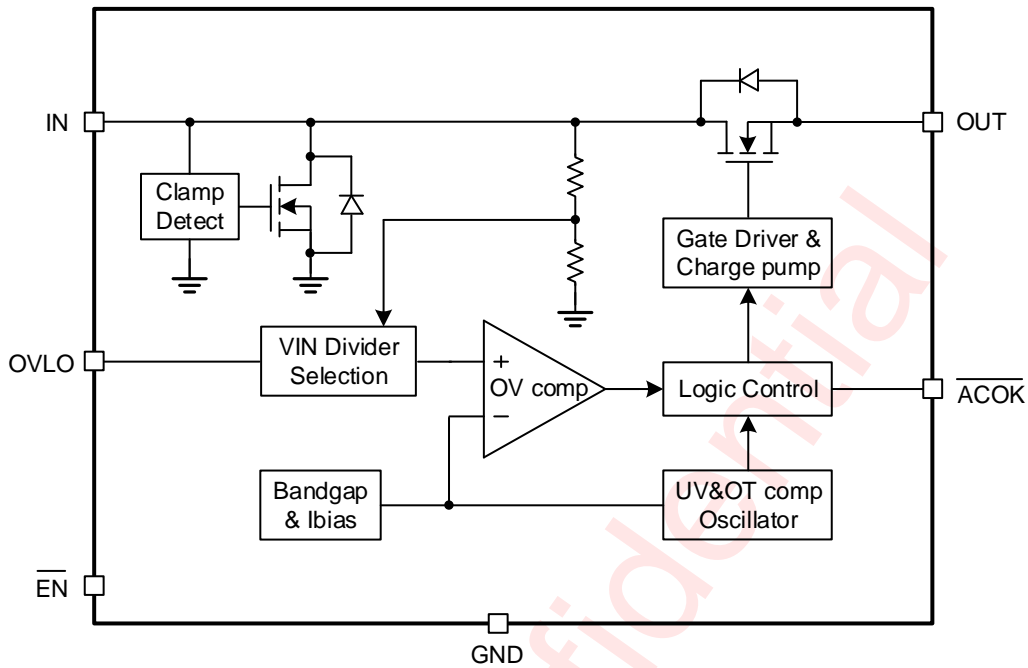

Figure 3 Functional Block Diagram

Typical Application Circuits

Figure 4 AW32915 Typical Application Circuit(Using Default OVP Threshold)

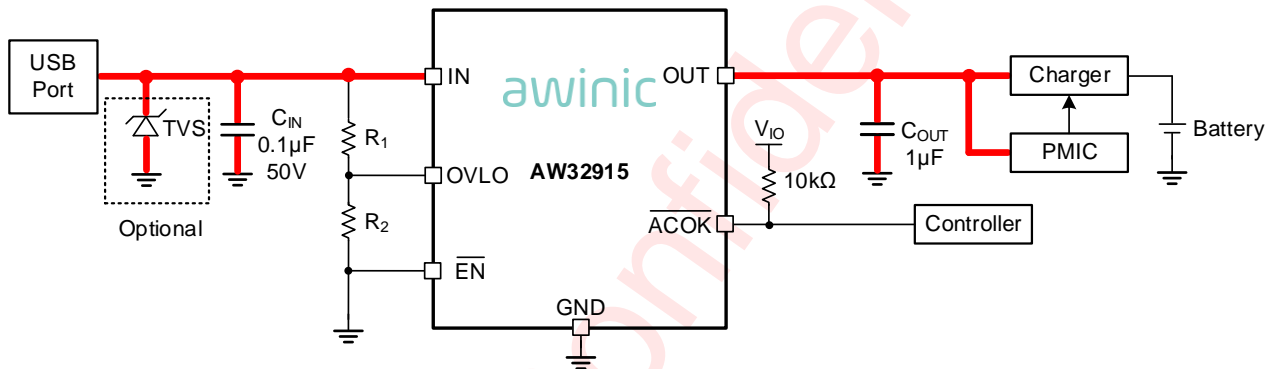

Figure 5 AW32915 Typical Application Circuit(Using External Resistors Set OVP Threshold)

Notice for Typical Application Circuits:

1. If VBUS is required to pass surge voltage greater than 100V, external TVS is needed, the maximum clamping voltage of the TVS should be below 32V.
2. When the default OVP threshold is used, connect OVLO pin to GND directly or through a 0Ω resistor. **OVLO pin cannot be left floating.**
3. If R₁ and R₂ are used to adjust the OVP threshold, it is better to use 1% precision resistors to improve the OVP threshold precision.
4. If $\overline{\text{ACOK}}$ is not used, it can be left floating, or short to GND.
5. C_{IN} = 0.1µF is recommended for typical application, larger C_{IN} is also acceptable. The rated voltage of C_{IN} should be larger than the TVS maximum clamping voltage, if no TVS is applied and only AW32915 is used, the rated voltage of C_{IN} should be 50V.
6. C_{OUT} = 1µF is recommended for typical application, larger C_{OUT} is also acceptable. The rated voltage of C_{OUT} should be larger than the OVP threshold. For example, if the OVP threshold is 6.8V, the rated voltage of C_{OUT} should be 10V or higher.

Figure 16 100V Surge Response

Functional Description

Device Operation

If the AW32915 is enabled and the input voltage is between UVLO and OVP threshold, the internal charge pump begins to work after debounce time, the gate of the nFET switch will be slowly charged high till the switch is fully on. $\overline{\text{ACOK}}$ will be driven low about 30ms after V_{IN} valid, indicating the switch is on with a good power input. If the input voltage exceeds the OVP trip level, the switch will be turned off in about 100ns. If $\overline{\text{EN}}$ is pulled high, or input voltage falls below UVLO threshold, or over-temperature happens, the switch will also be turned off.

Surge Protection

The AW32915 integrates a clamp circuit to suppress input surge voltage. For surge voltages between $V_{\text{IN_OVLO}}$ and $V_{\text{IN_CLAMP}}$, the switch will be turned off but the clamp circuit will not work. For surge voltages greater than $V_{\text{IN_CLAMP}}$, the internal clamp circuit will detect surge voltage level and discharge the surge energy to ground. The device can suppress surge voltages up to 100V.

Over-Voltage Protection

If the input voltage exceeds the OVP rising trip level, the switch will be turned off in about 100ns. The switch will remain off until V_{IN} falls below the OVP falling trip level.

OVP Threshold Adjustment

If the default OVP threshold is used, OVLO pin must be grounded. If OVLO pin is not grounded, and by connecting external resistor divider to OVLO pin as shown in the typical application circuit, between IN and GND, the OVP threshold can be adjusted as following:

$$V_{\text{IN_OVLO}} = \frac{R_1 + R_2}{R_2} V_{\text{OVLO_TH}}$$

For example, if we select $R_1 = 1\text{M}\Omega$ and $R_2 = 100\text{k}\Omega$, then the new OVP threshold calculated from the above formula is 13.2V. The OVP threshold adjustment range is from 4V to 24V. When the OVLO pin voltage V_{OVLO} exceeds $V_{\text{OVLO_SEL}}$ (0.26V typical), V_{OVLO} is compared with the reference voltage $V_{\text{OVLO_TH}}$ (1.2V typical) to judge whether input supply is over-voltage.

$\overline{\text{ACOK}}$ Output

The device features an open-drain output $\overline{\text{ACOK}}$, it should be connected to the system I/O rail through a pull-up resistor. If the device is enabled and $V_{\text{IN_UVLO}} < V_{\text{IN}} < V_{\text{IN_OVLO}}$, $\overline{\text{ACOK}}$ will be driven low indicating the switch is on with a good power input. If OVP, UVLO, or OT occurs, or $\overline{\text{EN}}$ is pulled high, the switch will be turned off and $\overline{\text{ACOK}}$ will be pulled high.

USB On-The-Go (OTG) Operation

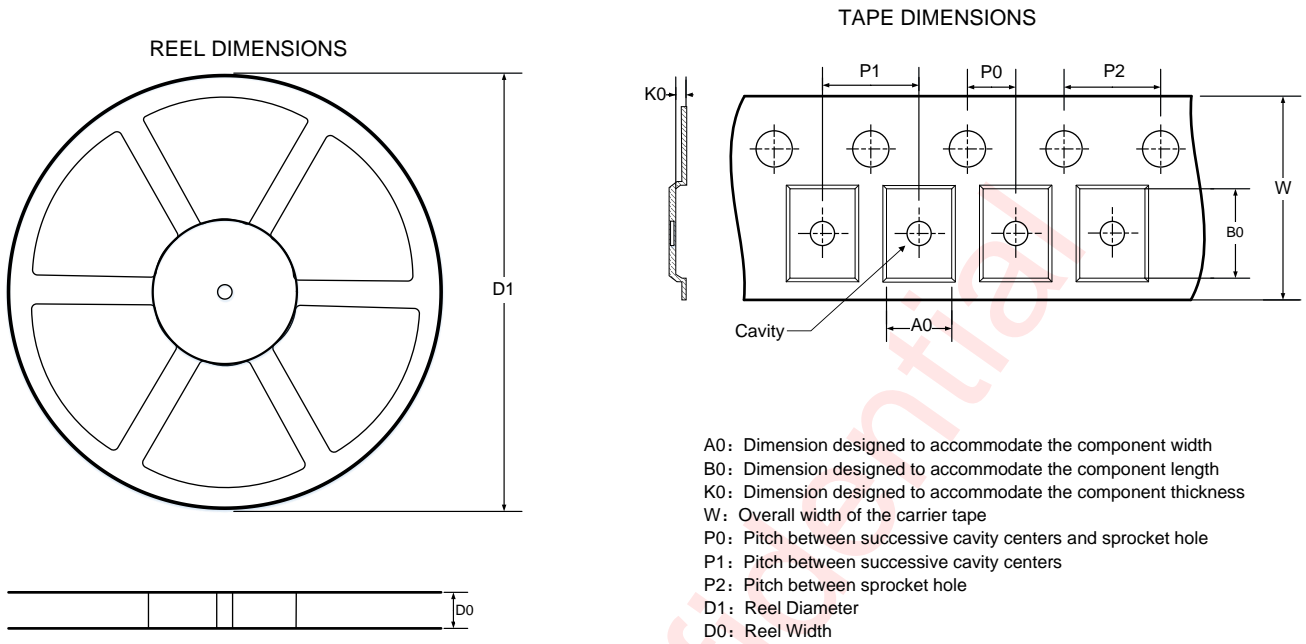

If $V_{\text{IN}} = 0\text{V}$ and OUT is supplied by OTG voltage, the body diode of the load switch conducts current from OUT to IN and the voltage drop from OUT to IN is approximately 0.7V. When $V_{\text{IN}} > V_{\text{IN_UVLO}}$, internal charge pump begins to open the load switch after debounce time (about 15ms). After switch is fully on, current is supplied through switch channel and the voltage drop from OUT to IN is minimum.

PCB Layout Consideration

To make fully use of the performance of AW32915, the guidelines below should be followed.

1. All the peripherals should be placed as close to the device as possible. Place the input capacitor C_{IN} on the top layer and close to IN pin, and place the output capacitor C_{OUT} on the top layer and close to OUT pin.
2. If external TVS is used, IN pin routing passes through the external TVS firstly, and then connect AW32915.
3. Red bold paths on figure 4 and 5 are power lines that will flow large current, please route them on PCB as straight, wide and short as possible.
4. If R_1 and R_2 are used, route OVLO line on PCB as short as possible to reduce parasitic capacitance.
5. The power trace from USB connector to AW32915 may suffer from ESD event, keep other traces away from it to minimize possible EMI and ESD coupling.
6. Use rounded corners on the power trace from USB connector to AW32915 to decrease EMI coupling.
