

Features

- **HB LED Controller**
 - Configurable Dimmers Support up to four Independent LED Channels
 - 8 to 32 Bits of Resolution per Channel
 - Dynamic Reconfiguration Enables LED Controller Plus Other Features: CapSense, Battery Charging, and Motor Control
- **Visual Embedded Design**
 - LED-Based Drivers
 - Binning Compensation
 - Temperature Feedback
 - Optical Feedback
 - DMX512
- **PrISM Modulation Technology**
 - Reduces Radiated EMI
 - Reduces Low Frequency Blinking
- **Advanced Peripherals (PSoC® Blocks)**
 - Four Digital PSoC Blocks Provide:
 - 8 to 32-Bit Timers, Counters, and PWMs
 - Full-duplex UART
 - Multiple SPI Masters or Slaves
 - Connectable to all GPI/O pins
 - Six Rail-to-Rail Analog PSoC Blocks Provide:
 - Up to 14-Bit ADCs
 - Up to 9-Bit DACs
 - Programmable Gain Amplifiers
 - Programmable Filters And Comparators
 - Complex Peripherals By Combining Blocks
 - Capacitive Sensing Application Capability
- **Complete Development Tools**
 - Free Development Software
 - PSoC Designer™
 - Full Featured, In-Circuit Emulator and Programmer
 - Full Speed Emulation
 - Complex Breakpoint Structure
 - 128 KBytes Trace Memory
- **Programmable Pin Configurations**
 - 25 mA Sink, 10 mA Source on all GPI/O
 - Pull Up, Pull Down, High Z, Strong, or Open Drain Drive Modes on all GPI/O
 - Up to 12 Analog Inputs on GPI/O
 - Four 30 mA Analog Outputs on GPI/O
 - Configurable Interrupt on all GPI/O
- **Flexible On-Chip Memory**
 - 16K Flash Program Storage 50,000 Erase/Write Cycles
 - 1K SRAM Data Storage
 - In-System Serial Programming (ISSP)
 - Partial Flash Updates
 - Flexible Protection Modes
 - EEPROM Emulation in Flash
- **Full Speed USB (12 Mbps)**
 - Four Uni-Directional Endpoints
 - One Bi-Directional Control Endpoint
 - USB 2.0 Compliant
 - Dedicated 256 Byte Buffer
 - No External Crystal Required

EZ-Color™ Functional Overview

Cypress's EZ-Color family of devices offers the ideal control solution for high brightness LED applications requiring intelligent dimming control. EZ-Color devices combine the power and flexibility of PSoC (Programmable System-on-Chip); with Cypress's PrISM (precise illumination signal modulation) modulation technology providing lighting designers a fully customizable and integrated lighting solution platform.

The EZ-Color family supports a range of independent LED channels from 4 channels at 32 bits of resolution each, up to 16 channels at 8 bits of resolution each. This enables lighting designers the flexibility to choose the LED array size and color quality. PSoC Designer software, with lighting specific drivers, can significantly cut development time and simplify implementation of fixed color points through temperature, optical, and LED binning compensation. EZ-Color's virtually limitless analog and digital customization enable simple integration of features in addition to intelligent lighting, such as CapSense, battery charging, image stabilization, and motor control during the development process. These features, along with Cypress's best-in-class quality and design support, make EZ-Color the ideal choice for intelligent HB LED control applications.

Target Applications

- LCD Backlight
- Large Signs
- General Lighting
- Architectural Lighting
- Camera/Cell Phone Flash
- Flashlights

The PSoC Core

The PSoC Core is a powerful engine that supports a rich feature set. The core includes a CPU, memory, clocks, and configurable GPIO (General Purpose I/O).

The M8C CPU core is a powerful processor with speeds up to 68 MHz, providing a four MIPS 8-bit Harvard architecture micro-processor. The CPU uses an interrupt controller with up to 20 vectors, to simplify programming of real time embedded events. Program execution is timed and protected using the included Sleep and Watch Dog Timers (WDT).

Memory encompasses 16K of Flash for program storage, 1K of SRAM for data storage, and up to 2K of EEPROM emulated using the Flash. Program Flash uses four protection levels on blocks of 64 bytes, allowing customized software IP protection.

The EZ-Color family incorporates flexible internal clock generators, including a 24 MHz IMO (internal main oscillator) accurate to 8 percent over temperature and voltage. The 24 MHz IMO can also be doubled to 48 MHz for use by the digital system. A low power 32 kHz ILO (internal low speed oscillator) is provided for the Sleep timer and WDT. The clocks, together with programmable clock dividers (as a System Resource), provide the flexibility to integrate almost any timing requirement into the EZ-Color device. In USB systems, the IMO self-tunes to $\pm 0.25\%$ accuracy for USB communication.

EZ-Color GPIOs provide connection to the CPU, digital and analog resources of the device. Each pin's drive mode may be selected from eight options, allowing great flexibility in external interfacing. Every pin can also generate a system interrupt on high level, low level, and change from last read.

The Digital System

The Digital System is composed of four digital PSoC blocks. Each block is an 8-bit resource that can be used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user module references.

Digital peripheral configurations include:

- PrISM (8 to 32 bit)
- Full speed USB (12 Mbps)
- PWMs (8 to 32 bit)
- PWMs with Dead band (8 to 24 bit)
- Counters (8 to 32 bit)
- Timers (8 to 32 bit)
- UART 8-bit with selectable parity
- SPI master and slave
- I2C slave and multi-master
- Cyclical Redundancy Checker/Generator (8 to 32 bit)
- IrDA
- Generators (8 to 32 bit)

The digital blocks can be connected to any GPIO through a series of global buses that can route any signal to any pin. The buses also allow for signal multiplexing and for performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

Digital blocks are provided in rows of four, where the number of blocks varies by EZ-Color device family. This allows you the optimum choice of system resources for your application. Family resources are shown in the table titled EZ-Color Device Characteristics.

Figure 1. Digital System Block Diagram

The Analog System

The Analog System is composed of six configurable blocks, each comprised of an opamp circuit allowing the creation of complex analog signal flows. Analog peripherals are very flexible and can be customized to support specific application requirements. Some of the more common EZ-Color analog functions (most available as user modules) are listed below.

- Analog-to-digital converters (up to 2, with 6- to 14-bit resolution, selectable as Incremental, Delta Sigma, and SAR)
- Filters (2 and 4 pole band-pass, low-pass, and notch)
- Amplifiers (up to 2, with selectable gain to 48x)
- Instrumentation amplifiers (1 with selectable gain to 93x)
- Comparators (up to 2, with 16 selectable thresholds)
- DACs (up to 2, with 6- to 9-bit resolution)
- Multiplying DACs (up to 2, with 6- to 9-bit resolution)
- High current output drivers (two with 30 mA drive as a PSoC Core Resource)
- 1.3V reference (as a System Resource)
- DTMF Dialer
- Modulators
- Correlators
- Peak Detectors
- Many other topologies possible

Analog blocks are arranged in a column of three, which includes one CT (Continuous Time) and two SC (Switched Capacitor) blocks, as shown in the figure below.

Figure 2. Analog System Block Diagram

The Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin in ports 0-5. Pins can be connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with comparators and analog-to-digital converters. It can be split into two sections for simultaneous dual-channel processing. An additional 8:1 analog input multiplexer provides a second path to bring Port 0 pins to the analog array.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Track pad, finger sensing.
- Chip-wide mux that allows analog input from up to 48 I/O pins.
- Crosspoint connection between any I/O pin combinations.

When designing capacitive sensing applications, refer to the latest signal-to-noise signal level requirements Application Notes, which can be found under <http://www.cypress.com> > Documentation. In general, and unless otherwise noted in the relevant Application Notes, the minimum signal-to-noise ratio (SNR) for CapSense applications is 5:1.

Additional System Resources

System Resources, provide additional capability useful to complete systems. Additional resources include a multiplier, decimator, low voltage detection, and power on reset. Brief statements describing the merits of each resource follow.

- Full-Speed USB (12 Mbps) with 5 configurable endpoints and 256 bytes of RAM. No external components required except two series resistors. Wider than commercial temperature USB operation (-10°C to +85°C).
- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks can be routed to both the digital and analog systems. Additional clocks can be generated using digital PSoC blocks as clock dividers.
- Two multiply accumulates (MACs) provide fast 8-bit multipliers with 32-bit accumulate, to assist in both general math as well as digital filters.
- Decimator provides a custom hardware filter for digital signal processing apps. including creation of Delta Sigma ADCs.
- The I2C module provides 100 and 400 kHz communication over two wires. Slave, master, multi-master are supported.
- Low Voltage Detection (LVD) interrupts signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.3V reference provides an absolute reference for the analog system, including ADCs and DACs.
- Versatile analog multiplexer system.

EZ-Color Device Characteristics

Depending on your EZ-Color device characteristics, the digital and analog systems can have 16, 8, or 4 digital blocks and 12, 6, or 4 analog blocks. The following table lists the resources available for specific EZ-Color device groups. The device covered by this data sheet is shown in the highlighted row of the table

Table 1. EZ-Color Device Characteristics

Getting Started

The quickest way to understand PSoC silicon is to read this data sheet and then use the PSoC Designer Integrated Development Environment (IDE). This data sheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the *PSoC® Programmable System-on-Chip Technical Reference Manual*.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device data sheets on the web at <http://www.cypress.com/ez-color>.

Application Notes

Application notes are an excellent introduction to the wide variety of possible PSoC designs. They are located here: www.cypress.com/psoc. Select Application Notes under the Documentation tab.

Development Kits

PSoC Development Kits are available online from Cypress at www.cypress.com/shop and through a growing number of regional and global distributors, which include Arrow, Avnet, Digi-Key, Farnell, Future Electronics, and Newark.

Training

Free PSoC technical training (on demand, webinars, and workshops) is available online at www.cypress.com/training. The training covers a wide variety of topics and skill levels to assist you in your designs.

Cypros Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to www.cypress.com/cypros.

Solutions Library

Visit our growing library of solution focused designs at www.cypress.com/solutions. Here you can find various application designs that include firmware and hardware design files that enable you to complete your designs quickly.

Development Tools

PSoC Designer is a Microsoft® Windows-based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE runs on Windows XP or Windows Vista.

This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and built-in support for third-party assemblers and C compilers.

PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family.

PSoC Designer Software Subsystems

System-Level View

A drag-and-drop visual embedded system design environment based on PSoC Designer. In the system level view you create a model of your system inputs, outputs, and communication interfaces. You define when and how an output device changes state based upon any or all other system devices. Based upon the design, PSoC Designer automatically selects one or more PSoC Mixed-Signal Controllers that match your system requirements.

PSoC Designer generates all embedded code, then compiles and links it into a programming file for a specific PSoC device.

Chip-Level View

The chip-level view is a more traditional Integrated Development Environment (IDE) based on PSoC Designer. Choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. Configure the user modules for your chosen application and connect them to each other and to the proper pins. Then generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic configuration allows for changing configurations at run time.

Hybrid Designs

You can begin in the system-level view, allow it to choose and configure your user modules, routing, and generate code, then switch to the chip-level view to gain complete control over on-chip resources. All views of the project share a common code editor, builder, and common debug, emulation, and programming tools.

Code Generation Tools

PSoC Designer supports multiple third party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

Assemblers. The assemblers allow assembly code to merge seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices.

The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write I/O registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

In-Circuit Emulator

A low cost, high functionality In-Circuit Emulator (ICE) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

Document Conventions

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 5 on page 13](#) lists all the abbreviations used to measure the PSoC devices.

Numeric Naming

Hexidecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexidecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (e.g., 01010100b or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimal.

Acronyms Used

The following table lists the acronyms that are used in this document.

Acronym	Description
AC	alternating current
ADC	analog-to-digital converter
API	application programming interface
CPU	central processing unit
CT	continuous time
DAC	digital-to-analog converter
DC	direct current
ECO	external crystal oscillator
EEPROM	electrically erasable programmable read-only memory
FSR	full scale range
GPI/O	general purpose I/O

Notes

- These are the ISSP pins, which are not High Z at POR.
- The center pad on the QFN package should be connected to ground (Vss) for best mechanical, thermal, and electrical performance. If not connected to ground, it should be electrically floated and not connected to any other signal.

Register Conventions

This section lists the registers of the CY8CLED04 EZ-Color device.

Abbreviations Used

The register conventions specific to this section are listed in the following table.

Convention	Description
R	Read register or bit(s)
W	Write register or bit(s)
L	Logical register or bit(s)
C	Clearable register or bit(s)
#	Access is bit specific

Register Mapping Tables

The device has a total register address space of 512 bytes. The register space is referred to as I/O space and is divided into two banks. The XO1 bit in the Flag register (CPU_F) determines which bank the user is currently in. When the XO1 bit is set the user is in Bank 1.

Note In the following register mapping tables, blank fields are Reserved and should not be accessed.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8CLED04 EZ-Color device. For the most up to date electrical specifications, confirm that you have the most recent data sheet by going to the web at

<http://www.cypress.com/ez-color>.

Specifications are valid for $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ and $T_J \leq 100^{\circ}\text{C}$, except where noted. Specifications for devices running at greater than 12 MHz are valid for $-40^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ and $T_J \leq 82^{\circ}\text{C}$.

Figure 4. Voltage versus CPU Frequency

The following table lists the units of measure that are used in this chapter.

Table 5. Units of Measure

Symbol	Unit of Measure	Symbol	Unit of Measure
$^{\circ}\text{C}$	degree Celsius	μW	microwatts
dB	decibels	mA	milli-ampere
fF	femto farad	ms	milli-second
Hz	hertz	mV	milli-volts
KB	1024 bytes	nA	nanoampere
Kbit	1024 bits	ns	nanosecond
kHz	kilohertz	nV	nanovolts
k Ω	kilohm	W	ohm
MHz	megahertz	pA	picoampere
M Ω	megaohm	pF	picofarad
μA	microampere	pp	peak-to-peak
μF	microfarad	ppm	parts per million
μH	microhenry	ps	picosecond
μs	microsecond	sps	samples per second
μV	microvolts	s	sigma: one standard deviation
μVrms	microvolts root-mean-square	V	volts

Absolute Maximum Ratings

Symbol	Description	Min	Typ	Max	Units	Notes
T _{STG}	Storage Temperature	-55	25	+100	°C	Higher storage temperatures will reduce data retention time. Recommended storage temperature is +25°C ± 25°C. Extended duration storage temperatures above 65°C will degrade reliability.
T _A	Ambient Temperature with Power Applied	-40	–	+85	°C	
V _{dd}	Supply Voltage on Vdd Relative to Vss	-0.5	–	+6.0	V	
V _{I/O}	DC Input Voltage	Vss - 0.5	–	Vdd + 0.5	V	
V _{I/O2}	DC Voltage Applied to Tri-state	Vss - 0.5	–	Vdd + 0.5	V	
I _{MI/O}	Maximum Current into any Port Pin	-25	–	+50	mA	
I _{MAI/O}	Maximum Current into any Port Pin Configured as Analog Driver	-50	–	+50	mA	
ESD	Electro Static Discharge Voltage	2000	–	–	V	Human Body Model ESD.
LU	Latch-up Current	–	–	200	mA	

Operating Temperature

Symbol	Description	Min	Typ	Max	Units	Notes
T _A	Ambient Temperature	-40	–	+85	°C	
T _{AUSB}	Ambient Temperature using USB	-10	–	+85	°C	
T _J	Junction Temperature	-40	–	+100	°C	The temperature rise from ambient to junction is package specific. See “Thermal Impedance” on page 32. The user must limit the power consumption to comply with this requirement.

DC Electrical Characteristics

DC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

Symbol	Description	Min	Typ	Max	Units	Notes
V _{DD}	Supply Voltage	3.0	—	5.25	V	See DC POR and LVD specifications, Table 16 on page 21 .
I _{DD5}	Supply Current, I _{MO} = 24 MHz (5V)	—	14	27	mA	Conditions are V _{DD} = 5.0V, T _A = 25°C , CPU = 3 MHz, SYSCLK doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 93.75 kHz, analog power = off.
I _{DD3}	Supply Current, I _{MO} = 24 MHz (3.3V)	—	8	14	mA	Conditions are V _{DD} = 3.3V, T _A = 25°C , CPU = 3 MHz, SYSCLK doubler disabled, VC1 = 1.5 MHz, VC2 = 93.75 kHz, VC3 = 0.367 kHz, analog power = off.
I _{SB}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT ^[3]	—	3	6.5	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $-40^{\circ}\text{C} \leq T_A \leq 55^{\circ}\text{C}$, analog power = off.
I _{SBH}	Sleep (Mode) Current with POR, LVD, Sleep Timer, and WDT at high temperature. ^[3]	—	4	25	μA	Conditions are with internal slow speed oscillator, V _{DD} = 3.3V, $55^{\circ}\text{C} < T_A \leq 85^{\circ}\text{C}$, analog power = off.

DC General Purpose I/O Specifications

The following table lists guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

V _{OL}	Low Output Level	—	—	0.75	V	I/OL = 25 mA, V _{DD} = 4.75 to 5.25V (8 total loads, 4 on even port pins (for example, P0[2], P1[4]), 4 on odd port pins (for example, P0[3], P1[5])). 200 mA maximum combined I/OL budget.
I _{OH}	High Level Source Current	10	—	—	mA	VOH = V _{DD} -1.0V. See the limitations of the total current in the Note for VOH.
I _{OL}	Low Level Sink Current	25	—	—	mA	VOL = 0.75V. See the limitations of the total current in the Note for VOL.
V _{IL}	Input Low Level	—	—	0.8	V	V _{DD} = 3.0 to 5.25.
V _{IH}	Input High Level	2.1	—	—	V	V _{DD} = 3.0 to 5.25.

Note

- Standby current includes all functions (POR, LVD, WDT, Sleep Time) needed for reliable system operation. This should be compared with devices that have similar functions enabled.

DC Operational Amplifier Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

The Operational Amplifier is a component of both the Analog Continuous Time PSoC blocks and the Analog Switched Capacitor PSoC blocks. The guaranteed specifications are measured in the Analog Continuous Time PSoC block.

DC Analog Reference Specifications

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V and 3.3V at 25°C and are for design guidance only.

The guaranteed specifications are measured through the Analog Continuous Time PSoC blocks. The power levels for AGND refer to the power of the Analog Continuous Time PSoC block. The power levels for RefHi and RefLo refer to the Analog Reference Control register. The limits stated for AGND include the offset error of the AGND buffer local to the Analog Continuous Time PSoC block. Reference control power is high.

Flash _{ENT}	Flash Endurance (total) ^[9]	1,800,000	–	–	–	Erase/write cycles.
Flash _{DR}	Flash Data Retention	10	–	–	Years	

Notes

8. The 50,000 cycle Flash endurance per block will only be guaranteed if the Flash is operating within one voltage range. Voltage ranges are 3.0V to 3.6V and 4.75V to 5.25V.
9. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles). For the full industrial range, the user must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the Flash APIs Application Note AN2015 at <http://www.cypress.com> under Application Notes for more information.

When bypassed by a capacitor on P2[4], the noise of the analog ground signal distributed to each block is reduced by a factor of up to 5 (14 dB). This is at frequencies above the corner frequency defined by the on-chip 8.1k resistance and the external capacitor.

Figure 7. Typical AGND Noise with P2[4] Bypass

At low frequencies, the opamp noise is proportional to $1/f$, power independent, and determined by device geometry. At high frequencies, increased power level reduces the noise spectrum level.

Figure 9. Definition for Timing for Fast-/Standard-Mode on the I²C Bus

Note

16. A Fast-Mode I²C-bus device can be used in a Standard-Mode I²C-bus system, but the requirement $t_{\text{SU;DAT}} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{\text{rmax}} + t_{\text{SU;DAT}} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

Packaging Information

This section illustrates the package specification for the CY8CLED04 EZ-Color device, along with the thermal impedance for the package and solder reflow peak temperatures.

Important Note Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

Figure 10. 68-Pin (8X8X0.90 mm) QFN (Sawn Type)

001-09618 *C

Important Note For information on the preferred dimensions for mounting QFN packages, see the following Application Note at http://www.amkor.com/products/notes_papers/MLFAppNote.pdf.

Important Note Pinned vias for thermal conduction are not required for the low-power device.

Thermal Impedance

Package	Typical θ_{JA} ^[17, 18]
68 QFN	13.05°C/W

Solder Reflow Peak Temperature

Following is the minimum solder reflow peak temperature to achieve good solderability.

Package	Minimum Peak Temperature ^[19]	Maximum Peak Temperature
68 QFN	240°C	260°C

Notes

17. $T_J = T_A + \text{POWER} \times \theta_{JA}$

18. To achieve the thermal impedance specified for the QFN package, the center thermal pad should be soldered to the PCB ground plane.

19. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220 ± 5°C with Sn-Pb or 245 ± 5°C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Development Tools

Software

This section presents the development tools available for all current PSoC device families including the CY8CLED04 EZ-Color.

PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer, used to generate PSoC firmware applications. PSoC Designer is available free of charge at <http://www.cypress.com/psocdesigner> and includes a free C compiler.

PSoC Programmer

Flexible enough to be used on the bench in development, yet suitable for factory programming, PSoC Programmer works either as a standalone programming application or it can operate directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE-Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free of charge at <http://www.cypress.com/psocprogrammer>.

Evaluation Tools

All evaluation tools can be purchased from the Cypress Online Store.

CY3261A-RGB EZ-Color RGB Kit

The CY3261A-RGB board is a preprogrammed HB LED color mix board with seven pre-set colors using the CY8CLED16 EZ-Color HB LED Controller. The board is accompanied by a CD containing the color selector software application, PSoC Designer, PSoC Programmer, and a suite of documents, schematics, and firmware examples. The color selector software application can be installed on a host PC and is used to control the EZ-Color HB LED controller using the included USB cable. The application enables you to select colors via a CIE 1931 chart or by entering coordinates. The kit includes:

- Training Board (CY8CLED16)
- One mini-A to mini-B USB Cable
- PSoC Designer CD-ROM
- Design Files and Application Installation CD-ROM

To program and tune this kit via PSoC Designer you must use a Mini Programmer Unit (CY3217 Kit) and a CY3240-I2CUSB kit.

CY3263-ColorLock Evaluation Kit

The CY3263-ColorLock evaluation board demonstrates the ability of the EZ-Color device to use real-time optical feedback to control three primary, high brightness LEDs and create accurate, mixed-color output. The kit includes:

- CY3263-ColorLock Evaluation Board
- Tools CD, which includes:
 - PSoC Programmer
 - .NET Framework 2.0 (for Windows 2000 and Windows XP)
 - PSoC Designer
 - ColorLock Express Pack
 - CY3263-ColorLock EZ-Color Kit CD
 - ColorLock Monitor Application
 - Kit Documents (Quick Start, Kit Guide, Release Note, Application Note, Data Sheets, Schematics, and Layouts)
 - Firmware
- Retractable USB Cable (A to Mini-B)
- PSoC MiniProg Programmer
- Power Supply Adapter

CY3265-RGB EZ-Color Evaluation Kit

The CY3265-RGB evaluation board demonstrates the ability of the EZ-Color device to use real-time temperature feedback to control three primary, high brightness LEDs and create accurate, mixed-color output. There are three variations of the kit available, depending on the LED manufacturer of the LEDs on the board: CY3265C-RGB (Cree LEDs), CY3265N-RGB (Nichia LEDs), or CY3265O-RGB (OSRAM LEDs). The kit includes:

- CY3265C-RGB Evaluation Board
- Tools CD, which includes:
 - PSoC Programmer
 - PSoC Designer
 - .NET Framework 2.0 (Windows XP 32 bit)
- Kit Documents (Quick Start, Kit Guide, Release Note, Application Note, Data Sheets, Schematics, and Layouts) Firmware
- Blue PCA Enclosure/Case
- 12V 1A Power Supply
- Retractable USB Cable (A to Mini-B)
- PSoC MiniProg Programmer
- Quick Start Guide

CY3210-MiniProg1

The CY3210-MiniProg1 kit allows a user to program PSoC devices via the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC via a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3210-PSoCEval1

The CY3210-PSoCEval1 kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of bread-boarding space to meet all of your evaluation needs. The kit includes:

- Evaluation Board with LCD Module
- MiniProg Programming Unit
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample (2)
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

Device Programmers

All device programmers can be purchased from the Cypress Online Store.

CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular Programmer Base
- 3 Programming Module Cards
- MiniProg Programming Unit
- PSoC Designer Software CD

■ Getting Started Guide

■ USB 2.0 Cable

CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production-programming environment.

Note CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

Accessories (Emulation and Programming)

Third Party Tools

Several tools have been specially designed by the following third-party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <http://www.cypress.com> under Design Support >> Development Kits/Boards.

Build a PSoC Emulator into Your Board

For details on how to emulate your circuit before going to volume production using an on-chip debug (OCD) non-production PSoC device, see Application Note "Debugging - Build a PSoC Emulator into Your Board - AN2323".

Notes

20. Flex-Pod kit includes a practice flex-pod and a practice PCB, in addition to two flex-pods.

21. Programming adapter converts non-DIP package to DIP footprint. Specific details and ordering information for each of the adapters can be found at <http://www.emulation.com>.
