# TPS61087 650-kHz,1.2-MHz, 18.5-V Step-Up DC-DC Converter With 3.2-A Switch

## 1 Features

- 2.5-V to 6-V Input Voltage Range
- 18.5-V Boost Converter With 3.2-A Switch Current
- 650-kHz, 1.2-MHz Selectable Switching Frequency
- Adjustable Soft-Start
- Thermal Shutdown
- Undervoltage Lockout
- 10-Pin QFN and Thin QFN Packages

## 2 Applications

- Handheld Devices
- GPS Receivers
- Digital Still Cameras
- Portable Applications
- DSL Modems
- PCMCIA Cards
- TFT LCD Bias Supply

## 3 Description

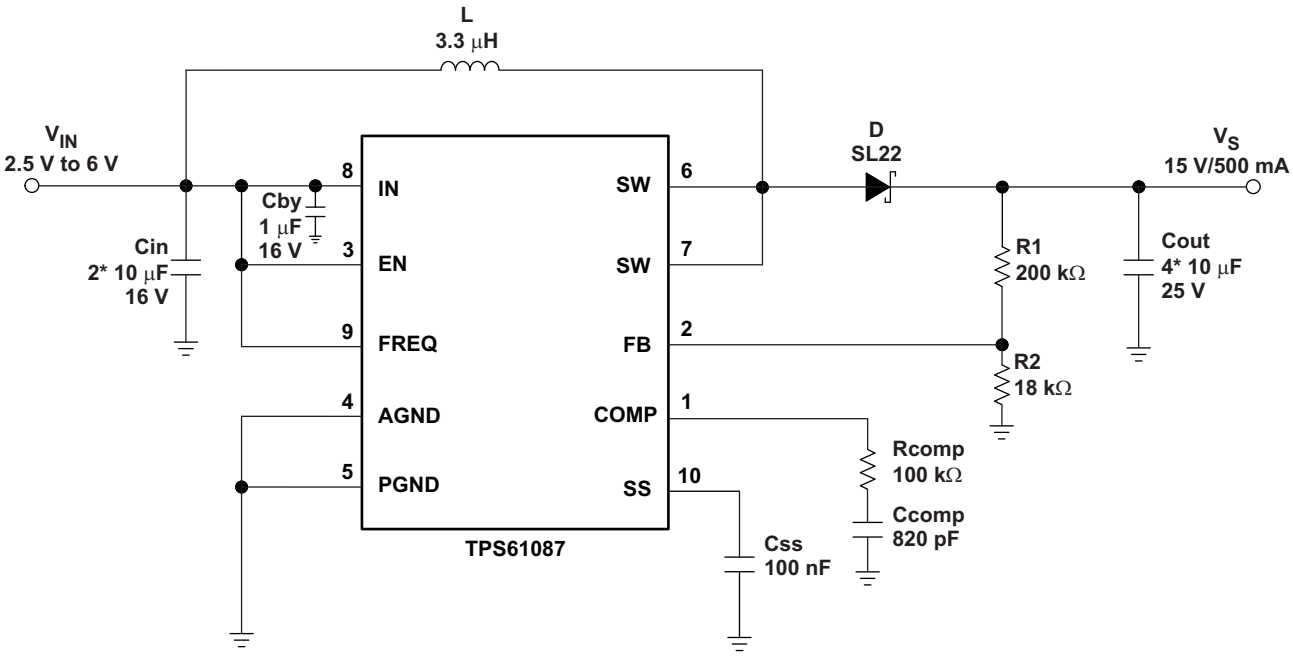

The TPS61087 is a high-frequency, high-efficiency DC-DC converter with an integrated 3.2-A, 0.13-Ω power switch capable of providing an output voltage up to 18.5 V. The selectable frequency of 650 kHz or 1.2 MHz allows the use of small external inductors and capacitors and provides fast transient response. The external compensation allows optimization of the application for specific conditions. A capacitor connected to the soft-start pin minimizes inrush current at startup.

**Device Information**[1]

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|---|---|---|
| TPS61087 | VSON (10) | 3.00 mm × 3.00 mm |
| | WSON (10) | |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

**Changes from Revision D (August 2014) to Revision E** — **Page**

- Changed device number from TPS61085 (typo) to TPS61087 (correct) in the Application Information description paragraph. ... 11
- Changed device number from TPS61085 (typo) to TPS61087 (correct) in the Power Supply Recommendations section. ... 22

**Changes from Revision C (July 2013) to Revision D** — **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ... 1

**Changes from Revision B (March 2010) to Revision C** — **Page**

- Added $V_{IH}$ Test Condition for EN, $V_{IN}$ = 2.5 V to 4.3 V ... 6

**Changes from Revision A (June 2008) to Revision B** — **Page**

- Added DSC package to PIN ASSIGNMENT ... 4
- Deleted Lead temperature from Absolute Maximum Ratings ... 4
- Changed $f_{osc}$ to $f_S$ in Electrical Characteristics Boost Converter Oscillator Frequency ... 6
- Changed FREQ = high to FREQ = $V_{IN}$ in Electrical Characteristics Boost Converter Oscillator Frequency ... 6
- Changed FREQ = low to FREQ = GND in Electrical Characteristics Boost Converter Oscillator Frequency ... 6
- Added Maximum load current vs. Input voltage graph ... 6
- Added Maximum load current vs. Input voltage graph ... 6
- Changed f to $f_S$ and Frequency to Oscillator Frequency in Figure 6 ... 7
- Changed f to $f_S$ and Frequency to Oscillator Frequency in Figure 7 ... 7
- Changed the text in the Detailed Description. ... 9
- Changed "inductor current ripple is below 20%" to " inductor current ripple is below 35%" ... 13

# 5 Pin Configuration and Functions

**DRC (VSON), DSC (WSON) Package**
**10 Pins, 3 mm × 3 mm × 1 mm**
**Top View**

**Pin Functions**

| PIN | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| AGND | 4, Thermal Pad | | Analog ground |
| COMP | 1 | I/O | Compensation pin |
| EN | 3 | I | Shutdown control input. Connect this pin to logic high level to enable the device |
| FB | 2 | I | Feedback pin |
| FREQ | 9 | I | Frequency select pin. The power switch operates at 650 kHz if FREQ is connected to GND and at 1.2 MHz if FREQ is connected to IN |
| IN | 8 | I | Input supply pin |
| PGND | 5 | | Power ground |
| SS | 10 | O | Soft-start control pin. Connect a capacitor to this pin if soft-start needed. Open = no soft-start |
| SW | 6, 7 | I | Switch pin |

# 6 Specifications

## 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

| | MIN | MAX | UNIT |
|---|---|---|---|
| Input voltage range IN(2) | –0.3 | 7.0 | V |
| Voltage range on pins EN, FB, SS, FREQ, COMP | –0.3 | 7.0 | V |
| Voltage on pin SW | –0.3 | 20 | V |
| Continuous power dissipation | See *Thermal Information* | | |
| Operating junction temperature range | –40 | 150 | °C |
| Storage temperature range | –65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability
(2) All voltage values are with respect to network ground terminal.

## 6.2 ESD Ratings

| | | | VALUE | UNIT |
|---|---|---|---|---|
| $V_{(ESD)}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1) | ±2000 | V |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 (2) | ±500 | |
| | | Machine model (MM) | ±200 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±500 V may actually have higher performance.

## 6.3 Recommended Operating Conditions

| | | MIN | NOM | MAX | UNIT |
|---|---|---|---|---|---|
| $V_{IN}$ | Input voltage range | 2.5 | | 6 | V |
| $V_S$ | Boost output voltage range | $V_{IN}$ + 0.5 | | 18.5 | V |
| $T_A$ | Operating free-air temperature | –40 | | 85 | °C |
| $T_J$ | Operating junction temperature | –40 | | 125 | °C |

## 6.4 Thermal Information

| THERMAL METRIC (1) | | TPS61087 | | UNIT |
|---|---|---|---|---|
| | | DRC | DSC | |
| | | 10 PINS | 10 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 54.7 | 55.3 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 67.2 | 84.8 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 29.6 | 29.7 | °C/W |
| $\psi_{JT}$ | Junction-to-top characterization parameter | 2.3 | 5.4 | °C/W |
| $\psi_{JB}$ | Junction-to-board characterization parameter | 29.8 | 29.8 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | 15.6 | 10.9 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

## 6.5 Electrical Characteristics

$V_{IN}$ = 5 V, EN = $V_{IN}$, $V_S$ = 15 V, $T_A$ = –40°C to 85°C, typical values are at $T_A$ = 25°C (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| **SUPPLY** | | | | | | |
| $V_{IN}$ | Input voltage range | | 2.5 | | 6 | V |
| $I_Q$ | Operating quiescent current into IN | Device not switching, $V_{FB}$ = 1.3 V | | 75 | 100 | µA |
| $I_{SDVIN}$ | Shutdown current into IN | EN = GND | | | 1 | µA |
| $V_{UVLO}$ | Undervoltage lockout threshold | $V_{IN}$ falling | | | 2.4 | V |
| | | $V_{IN}$ rising | | | 2.5 | V |
| $T_{SD}$ | Thermal shutdown | Temperature rising | | 150 | | °C |
| $T_{SDHYS}$ | Thermal shutdown hysteresis | | | 14 | | °C |

# 7 Detailed Description

## 7.1 Overview

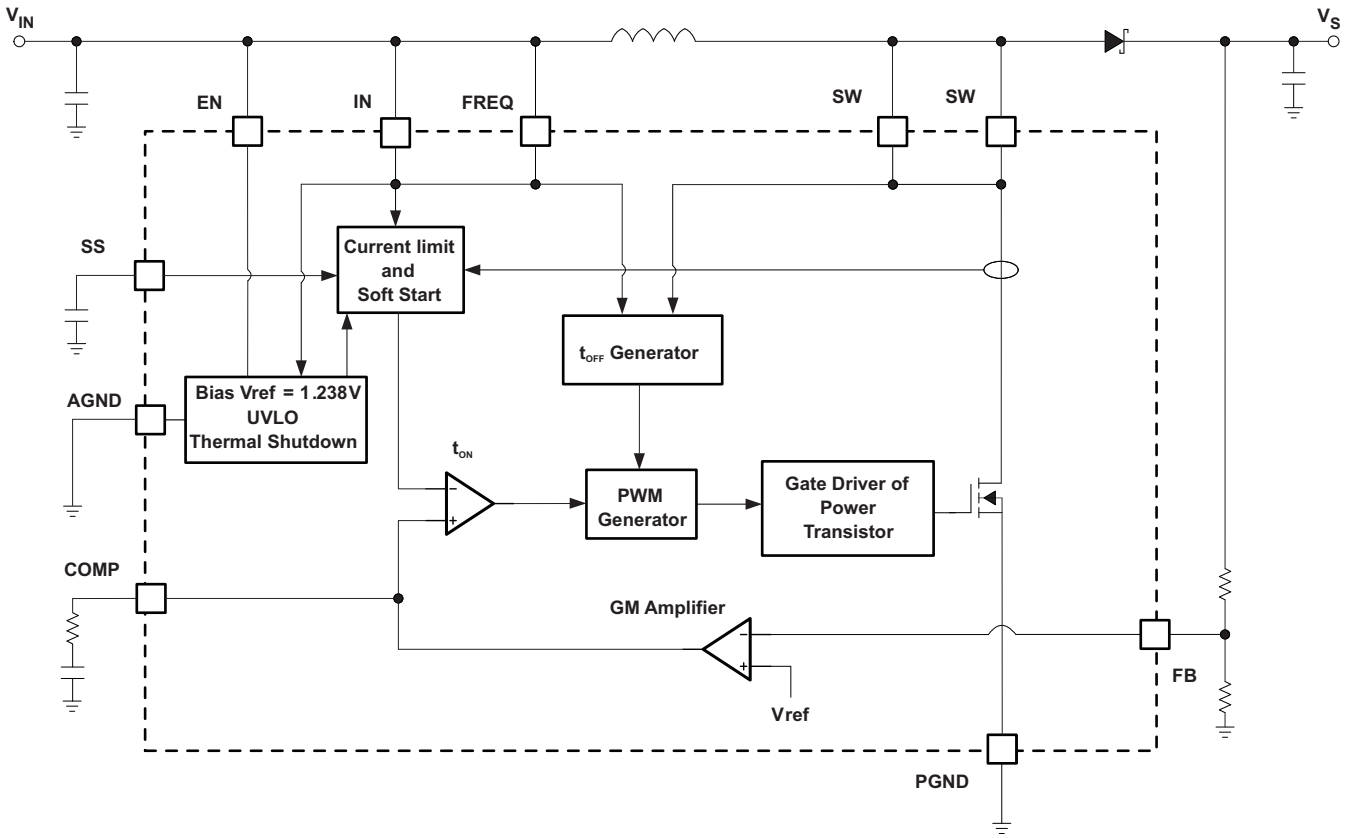

The boost converter is designed for output voltages of up to 18.5 V with a switch peak current limit of 3.2 A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz and 1.2 MHz, and the minimum input voltage is 2.5 V. To limit the inrush current at start-up, a soft-start pin is available.

The novel topology of the TPS60187 boost converter uses adaptive off-time to provide superior load and line transient responses. This topology also operates over a wider range of applications than conventional converters.

The selectable switching frequency offers the possibility to optimize the design either for the use of small-sized components (1.2 MHz) or for higher system efficiency (650 kHz). However, the frequency changes slightly because the voltage drop across the $r_{DS(on)}$ has some influence on the current and voltage measurement and thus on the on-time (the off-time remains constant).

The converter operates in continuous conduction mode (CCM) as soon as the input current increases above half the ripple current in the inductor, for lower load currents it switches into discontinuous conduction mode (DCM). If the load is further reduced, the part starts to skip pulses to maintain the output voltage.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Soft-Start

The boost converter has an adjustable soft-start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor, connected to the soft-start pin SS and charged with a constant current, is used to slowly ramp up the internal current limit of the boost converter. When the EN pin is pulled high, the soft-start capacitor $C_{SS}$ is immediately charged to 0.3 V. The capacitor is then charged at a constant current of 10 µA typically until the output of the boost converter $V_S$ has reached its Power Good threshold (roughly 98% of $V_S$ nominal value). During this time, the SS voltage directly controls the peak inductor current, starting with 0 A at $V_{SS}$ = 0.3 V up to the full current limit at $V_{SS}$ = 800 mV. The maximum load current is available after the soft-start is completed. The larger the capacitor the slower the ramp of the current limit and the longer the soft-start time. A 100-nF capacitor is usually sufficient for most of the applications. When the EN pin is pulled low, the soft-start capacitor is discharged to ground.

### 7.3.2 Frequency Select Pin (FREQ)

The frequency select pin FREQ allows to set the switching frequency of the device to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but reduces slightly the efficiency. The other benefits of higher switching frequency are a lower output ripple voltage. The use of a 1.2-MHz switching frequency is recommended unless light load efficiency is a major concern.

### 7.3.3 Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages an undervoltage lockout is included that disables the device, if the input voltage falls below 2.4 V.

### 7.3.4 Thermal Shutdown

A thermal shutdown is implemented to prevent damages due to excessive heat and power dissipation. Typically the thermal shutdown happens at a junction temperature of 150°C. When the thermal shutdown is triggered the device stops switching until the junction temperature falls below typically 136°C. Then the device starts switching again.

### 7.3.5 Overvoltage Prevention

If overvoltage is detected on the FB pin (typically 3% above the nominal value of 1.238 V) the part stops switching immediately until the voltage on this pin drops to its nominal value. This prevents overvoltage on the output and secures the circuits connected to the output from excessive overvoltage.

## 7.4 Device Functional Modes

The converter operates in continuous conduction mode (CCM) as soon as the input current increases above half the ripple current in the inductor, for lower load currents it switches into discontinuous conduction mode (DCM). If the load is further reduced, the part starts to skip pulses to maintain the output voltage.

# 8 Application and Implementation

**NOTE**

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

The TPS61087 is designed for output voltages up to 18.5 V with a switch peak current limit of 2.0-A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz and 1.2 MHz, and the input voltage range is 2.3 V to 6.0 V. To control the inrush current at start-up a soft-start pin is available. The following section provides a step-by-step design approach for configuring the TPS61087 as a voltage regulating boost converter.

## 8.2 Typical Application

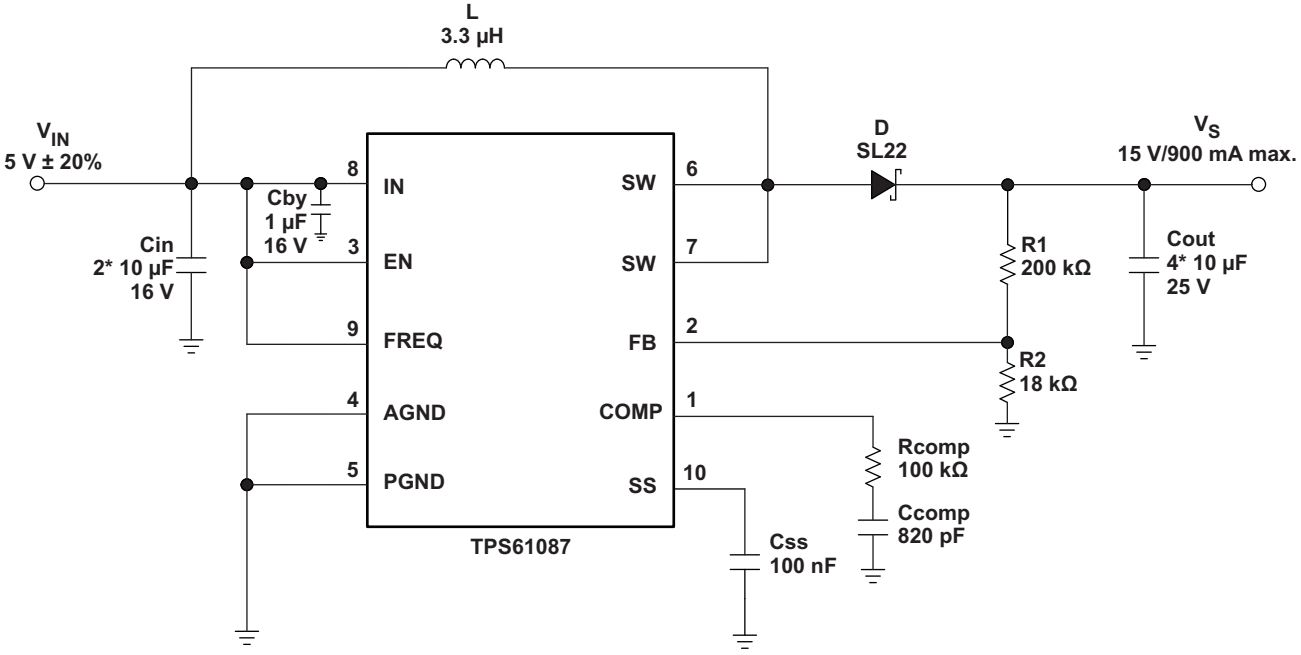

**Figure 8. Typical Application, 5 V to 15 V ($f_S$ = 1.2 MHz)**

### 8.2.1 Design Requirements

**Table 2. TPS61087 15-V Output Design Requirements**

| PARAMETERS | VALUES |
|---|---|
| Input Voltage | 5 V ± 20% |
| Output Voltage | 15 V |
| Output Current | 900 mA |
| Switching Frequency | 1.2 MHz |

Copyright © 2008–2019, Texas Instruments Incorporated

### 8.2.2 Detailed Design Procedure

The first step in the design procedure is to verify that the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst case assumption for the expected efficiency, for example, 90%.

1. Duty cycle, *D*:

$$D = 1 - \frac{V_{IN} \cdot \eta}{V_S} \tag{1}$$

2. Maximum output current, $I_{out(max)}$ :

$$I_{out(\max)} = \left( I_{LIM(\min)} - \frac{\Delta I_L}{2} \right) \cdot (1 - D) \tag{2}$$

3. Peak switch current in application, $I_{swpeak}$ :

$$I_{swpeak} = \frac{\Delta I_L}{2} + \frac{I_{out}}{1 - D} \tag{3}$$

with the inductor peak-to-peak ripple current, $\Delta I_L$

$$\Delta I_L = \frac{V_{IN} \cdot D}{f_S \cdot L} \tag{4}$$

and

| | |
|---|---|
| $V_{IN}$ | Minimum input voltage |
| $V_S$ | Output voltage |
| $I_{LIM(min)}$ | Converter switch current limit (minimum switch current limit = 3.2 A) |
| $f_S$ | Converter switching frequency (typically 1.2 MHz or 650 kHz) |
| $L$ | Selected inductor value |
| $\eta$ | Estimated converter efficiency (use the number from the efficiency plots or 90% as an estimation) |

The peak switch current is the steady state peak switch current that the integrated switch, inductor and external Schottky diode has to be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is the highest.

#### *8.2.2.1 Inductor Selection*

The TPS61087 is designed to work with a wide range of inductors. The main parameter for the inductor selection is the saturation current of the inductor which should be higher than the peak switch current as calculated in the *Detailed Design Procedure* section with additional margin to cover for heavy load transients. An alternative, more conservative, is to choose an inductor with a saturation current at least as high as the maximum switch current limit of 4.8 A. The other important parameter is the inductor DC resistance. Usually the lower the DC resistance the higher the efficiency. It is important to note that the inductor DC resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching frequencies of 1.2 MHz inductor core losses, proximity effects and skin effects become more important. Usually an inductor with a larger form factor gives higher efficiency. The efficiency difference between different inductors can vary between 2% to 10%. For the TPS61087, inductor values between 3 µH and 6 µH are a good choice with a switching frequency of 1.2 MHz, typically 3.3 µH. At 650 kHz TI recommends inductors between 6 µH and 13 µH, typically 6.8 µH. Possible inductors are shown in Table 3.

Copyright © 2008–2019, Texas Instruments Incorporated

Typically, TI recommends an inductor current ripple below 35% of the average inductor current. Therefore, the following equation can be used to calculate the inductor value, *L*:

$$L = \left(\frac{V_{IN}}{V_S}\right)^2 \cdot \left(\frac{V_S - V_{IN}}{I_{out} \cdot f_S}\right) \cdot \left(\frac{\eta}{0.35}\right) \quad (5)$$

with

| | |
|---|---|
| $V_{IN}$ | Minimum input voltage |
| $V_S$ | Output voltage |
| $I_{out}$ | Maximum output current in the application |
| $f_S$ | Converter switching frequency (typically 1.2 MHz or 650 kHz) |
| $\eta$ | Estimated converter efficiency (use the number from the efficiency plots or 90% as an estimation) |

**Table 3. Inductor Selection**

| L (µH) | SUPPLIER | COMPONENT CODE | SIZE (L×W×H mm) | DCR TYP (mΩ) | $I_{sat}$ (A) |
|---|---|---|---|---|---|
| **1.2 MHz** | | | | | |
| 4.2 | Sumida | CDRH5D28 | 5.7 × 5.7 × 3 | 23 | 2.2 |
| 4.7 | Wurth Elektronik | 7447785004 | 5.9 × 6.2 × 3.3 | 60 | 2.5 |
| 5 | Coilcraft | MSS7341 | 7.3 × 7.3 × 4.1 | 24 | 2.9 |
| 5 | Sumida | CDRH6D28 | 7 × 7 × 3 | 23 | 2.4 |
| 4.6 | Sumida | CDR7D28 | 7.6 × 7.6 × 3 | 38 | 3.15 |
| 4.7 | Wurth Elektronik | 7447789004 | 7.3 × 7.3 × 3.2 | 33 | 3.9 |
| 3.3 | Wurth Elektronik | 7447789003 | 7.3 × 7.3 × 3.2 | 30 | 4.2 |
| **650 kHz** | | | | | |
| 10 | Wurth Elektronik | 744778910 | 7.3 × 7.3 × 3.2 | 51 | 2.2 |
| 10 | Sumida | CDRH8D28 | 8.3 × 8.3 × 3 | 36 | 2.7 |
| 6.8 | Sumida | CDRH6D26HPNP | 7 × 7 × 2.8 | 52 | 2.9 |

| 10 | Sumida | CDRH8D43 | 8.3 × 8.3 × 4.5 | 29 | 4 |
| 6.8 | Wurth Elektronik | 74454068 | 12.7 × 10 × 4.9 | 55 | 4.1 |

#### *8.2.2.2 Rectifier Diode Selection*

To achieve high efficiency a Schottky type should be used for the rectifier diode. The reverse voltage rating should be higher than the maximum output voltage of the converter. The averaged rectified forward current $I_{avg}$ , the Schottky diode needs to be rated for, is equal to the output current $I_{out}$ :

$$I_{avg} = I_{out} \quad (6)$$

Usually a Schottky diode with 2-A maximum average rectified forward current rating is sufficient for most applications. The Schottky rectifier can be selected with lower forward current capability depending on the output current $I_{out}$ but has to be able to dissipate the power. The dissipated power, $P_D$ , is the average rectified forward current times the diode forward voltage, $V_{forward}$ .

$$P_D = I_{avg} \cdot V_{forward} \quad (7)$$

Typically, the diode should be able to dissipate around 500 mW depending on the load current and forward voltage.

Copyright © 2008–2019, Texas Instruments Incorporated

**Table 4. Rectifier Diode Selection**

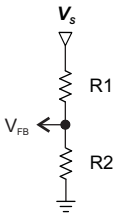

| CURRENT RATING $I_{avg}$ | $V_r$ | $V_{forward}/I_{avg}$ | SUPPLIER | COMPONENT CODE |
|---|---|---|---|---|
| 2 A | 20 V | 0.44 V / 2 A | Vishay Semiconductor | SL22 |
| 2 A | 20 V | 0.5 V / 2 A | Fairchild Semiconductor | SS22 |

### 8.2.2.3 Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of 50 µA flowing through the feedback divider gives good accuracy and noise covering. A standard low-side resistor of 18 kΩ is typically selected. The resistors are then calculated as:

$$R2 = \frac{V_{FB}}{70\mu A} \approx 18k\Omega \qquad R1 = R2 \cdot \left( \frac{V_S}{V_{FB}} - 1 \right)$$

$$V_{FB} = 1.238V$$

(8)

### 8.2.2.4 Compensation (COMP)

The regulator loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier.

Standard values of $R_{COMP}$ = *16 kΩ* and $C_{COMP}$ = *2.7 nF* will work for the majority of the applications.

See Table 5 for dedicated compensation networks giving an improved load transient response. The following equations can be used to calculate $R_{COMP}$ and $C_{COMP}$ :

$$R_{COMP} = \frac{110 \cdot V_{IN} \cdot V_S \cdot C_{out}}{L \cdot I_{out}} \qquad C_{COMP} = \frac{V_s \cdot C_{out}}{7.5 \cdot I_{out} \cdot R_{COMP}}$$

(9)

with

| | |
|---|---|

| $V_S$ | Output voltage |
| $C_{out}$ | Output capacitance |
| $L$ | Inductor value, for example, 3.3 µH or 6.8 µH |
| $I_{out}$ | Maximum output current in the application |

Make sure that $R_{COMP}$ < *120 kΩ* and $C_{COMP}$> *820 pF*, independent of the results of the above formulas.

**Table 5. Recommended Compensation Network Values at High/Low Frequency**

| FREQUENCY | L | $V_S$ | $V_{IN}$ ± 20% | $R_{COMP}$ | $C_{COMP}$ |
|---|---|---|---|---|---|
| High (1.2 MHz) | 3.3 µH | 15 V | 5 V | 100 kΩ | 820 pF |
| | | | 3.3 V | 91 kΩ | 1.2 nF |
| | | 12 V | 5 V | 68 kΩ | 820 pF |
| | | | 3.3 V | 68 kΩ | 1.2 nF |
| | | 9 V | 5 V | 39 kΩ | 820 pF |
| | | | 3.3 V | 39 kΩ | 1.2 nF |
| Low (650 kHz) | 6.8 µH | 15 V | 5 V | 51 kΩ | 1.5 nF |
| | | | 3.3 V | 47 kΩ | 2.7 nF |
| | | 12 V | 5 V | 33 kΩ | 1.5 nF |
| | | | 3.3 V | 33 kΩ | 2.7 nF |
| | | 9 V | 5 V | 18 kΩ | 1.5 nF |
| | | | 3.3 V | 18 kΩ | 2.7 nF |

Copyright © 2008–2019, Texas Instruments Incorporated

Table 5 gives conservative $R_{COMP}$ and $C_{COMP}$ values for certain inductors, input and output voltages providing a very stable system. For a faster response time, a higher $R_{COMP}$ value can be used to enlarge the bandwidth, as well as a slightly lower value of $C_{COMP}$ to keep enough phase margin. These adjustments should be performed in parallel with the load transient response monitoring of TPS61087.

#### 8.2.2.5 Input Capacitor Selection

For good input voltage filtering low ESR ceramic capacitors are recommended. TPS61087 has an analog input IN. Therefore, a 1-µF bypass is highly recommended as close as possible to the IC from IN to GND.

Two 10-µF (or one 22-µF) ceramic input capacitors are sufficient for most of the applications. For better input voltage filtering this value can be increased. See Table 6 and typical applications for input capacitor recommendation.

#### 8.2.2.6 Output Capacitor Selection

For best output voltage filtering a low ESR output capacitor like ceramic capcaitor is recommended. Four 10-µF ceramic output capacitors (or two-22 µF) work for most of the applications. Higher capacitor values can be used to improve the load transient response. See Table 6 for the selection of the output capacitor.

**Table 6. Rectifier Input and Output Capacitor Selection**

| | CAPACITOR/SIZE | VOLTAGE RATING | SUPPLIER | COMPONENT CODE |
|---|---|---|---|---|
| $C_{IN}$ | 22 µF/1206 | 16 V | Taiyo Yuden | EMK316 BJ 226ML |
| IN bypass | 1 µF/0603 | 16 V | Taiyo Yuden | EMK107 BJ 105KA |
| $C_{OUT}$ | 10 µF/1206 | 25 V | Taiyo Yuden | TMK316 BJ 106KL |

To calculate the output voltage ripple, the following equation can be used:

$$\Delta V_C = \frac{V_S - V_{IN}}{V_S \cdot f_S} \cdot \frac{I_{out}}{C_{out}} \qquad \Delta V_{C_ESR} = I_{L(peak)} \cdot R_{C_ESR} \tag{10}$$

with

| | |
|---|---|
| $\Delta V_C$ | Output voltage ripple dependent on output capacitance,output current and switching frequency |
| $V_S$ | Output voltage |
| $V_{IN}$ | Minimum input voltage of boost converter |
| $f_S$ | Converter switching frequency (typically 1.2 MHz or 650 kHz) |
| $I_{out}$ | Output capacitance |
| $\Delta V_{C_ESR}$ | Output voltage ripple due to output capacitors ESR (equivalent series resistance) |
| $I_{SWPEAK}$ | Inductor peak switch current in the application |
| $R_{C_ESR}$ | Output capacitors equivalent series resistance (ESR) |

$\Delta V_{C_ESR}$ can be neglected in many cases since ceramic capacitors provide low ESR.

# 9 Power Supply Recommendations

The TPS61087 is designed to operate from an input voltage supply range from 2.3 V to 6.0 V. The power supply to the TPS61087 must have a current rating according to the supply voltage, output voltage, and output current of the TPS61087.

# 10 Layout

## 10.1 Layout Guidelines

For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground tracks. The input capacitor, output capacitor, and the inductor should be placed as close as possible to the IC. Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at the GND terminal of the IC. The most critical current path for all boost converters is from the switching FET, through the rectifier diode, then the output capacitors, and back to ground of the switching FET. Therefore, the output capacitors and their traces should be placed on the same board layer as the IC and as close as possible between the SW pin and the GND terminal of the IC..

# 11 Device and Documentation Support

## 11.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

## 11.2 Trademarks

All trademarks are the property of their respective owners.

## 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## 11.4 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

# 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

Copyright © 2008–2019, Texas Instruments Incorporated

## PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|---|---|---|---|---|---|---|---|---|---|---|---|
| TPS61087DRCR | ACTIVE | VSON | DRC | 10 | 3000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | PMOQ | Samples |
| TPS61087DRCRG4 | ACTIVE | VSON | DRC | 10 | 3000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | PMOQ | Samples |
| TPS61087DRCT | ACTIVE | VSON | DRC | 10 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | PMOQ | Samples |

| TPS61087DSCT | ACTIVE | WSON | DSC | 10 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | PMWI | Samples |

(1) The marketing status values are defined as follows:
**ACTIVE:** Product device recommended for new designs.
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
