

## 11V Fast Startup With F0 Detect And Tracking LRA Haptic Driver

### Features

- 1MHz I2C Bus
- 12-KByte Memory
- 12k/24k/48k input wave sampling rate
- F0 detect and tracking
- Advance autobrake engine integrated
- Playback mode:
  - Real time playback(Up to 4KByte FIFO)
  - Memory playback
  - I2S playback
  - 3 Trigger playback
  - One wire playback
  - Cont playback
- Resistance-Based LRA Diagnostics
- Drive signal monitor for LRA protect
- Drive Compensation Over Battery Discharge
- Fast Start Up Time < 1ms
- Dedicated interrupt output pin
- Boost output voltage up to 11V
- VOUT=8.5V@Vbat=4.2V for 8Ω LRA
- Support automatically switch to standby mode
- Standby current: 8uA@Vbat=3.6V
- Shutdown current: 0.1uA
- Supply voltage range 3 to 5.5V
- Short-Circuit Protection, Over-Temperature Protection, Under-Voltage Protection
- FCQFN 2mm × 3mm × 0.55mm -20L Package
- AW86917A included Immersion IP license
- AW86917B included Immersion IP and dedicated software license

### Applications

- Mobile phones
- Tablets
- Wearable Devices

### General Description

AW86917A/B is a high voltage H-bridge, single chip LRA haptic driver, with F0 detecting and tracking based on BEMF, with a boost converter up to 11V drive voltage inside, supporting real time playback, memory playback, cont playback, I2S playback, one wire and hardware pin triggered playback. A typical startup time of 1ms makes the AW86917A/B an ideal haptic driver for fast responses.

AW86917A/B integrates a 12KByte SRAM for user-defined waveforms to achieve a variety of vibration experiences, supporting 3 sampling rate(12k/24k/48k) of waveforms loaded in SRAM, supporting output waveform sampling rate up-sampling to 48k.

AW86917A/B integrates an autobrake engine to suppress the aftershocks to zero for different drive waveforms(short or long) on different LRA motor.

AW86917A/B supports LRA fault diagnostic based on resistance measurement and protections of short-circuit, over-temperature and under-voltage.

AW86917A/B integrates a high-efficiency boost converter as the H-Bridge driver supply rail. The output voltage, maximum current limit and maximum boost current are configurable.

AW86917A/B features configurable automatically switch to standby mode. This can less quiescent power consumption. Dedicated interrupt output pin can detect real time FIFO status and the error status of the chip.

AW86917A/B features general settings are communicated via an I2C-bus interface and its I2C address is configurable.

AW86917A/B is available in a FCQFN 2mm x 3mm x 0.55mm -20L package.

## Pin Configuration And Top Mark

Figure 1 Pin Configuration and Top Mark

## Pin Definition

PIN NUMBER	NAME	I/O	DESCRIPTION
1	RSTN	I	Active low hardware reset. High: standby/active mode Low: power-down mode. Internal have 2MΩ pull-down resistor
2	TRIG3/ DATAI	I	Hardware trigger 3 or DATAI in I2S mode. Must connect to GND when not used.
3	TRIG2/WCK	I	Hardware trigger 2 or WCK in I2S mode. Must connect to GND when not used.
4	TRIG1	I	Hardware trigger 1. Must connect to GND when not used.
5	HDN	O	Negative haptic driver differential output
6	PGND	Ground	H-bridge driver GND
7	HDP	O	Positive haptic driver differential output
8	PVDD	Power	High voltage driver power rail
9	AD	I	I2C bus address selection
10	VCP	O	Internal charge pump voltage
11	VBST	Power	Boost output voltage
12	SW	O	Internal boost switch pin
13	BGND	Ground	Boost GND
14	VBAT	Power	Chip power supply
15	GND	Ground	Supply ground
16	RCK/BCK	I	BCK input in I2S mode or PLL reference CLK input . IIC reg I2SBCK should be configured in 0x4A. Internal have 2MΩ pull-down resistor
17	VREG	Power	Digital power supply
18	SDA	IO	I2C bus data input/output(open drain)
19	SCL	I	I2C bus clock input
20	INTN	O	Interrupt open drain output, low active.

### Functional Block Diagram

### Typical Application Circuits

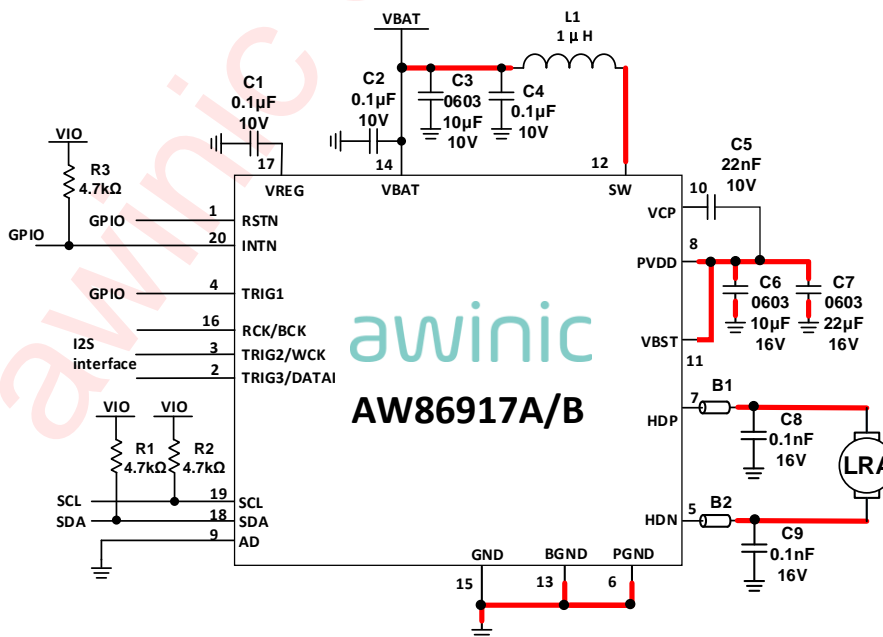

Figure 3 Typical Application Circuit of AW86917A/B

All trademarks are the property of their respective owners.

**Notice for Typical Application Circuits:**

1: Please place C1, C2, C3, C4, C5, C6, C7 as close to the chip as possible, and C6 and C7 close to PIN 11 and the capacitors should be placed in the same layer with the AW86917A/B chip.

2: For the sake of driving capability, the power lines (especially the one to Pin 12), output lines, and the connection lines of L1, and SW should be short and wide as possible. The power path marked in red as shown in the figures above. Please traces according to 3.5A power line alignment rules, for VBAT to SW through L1.

and the other red path traces according to 1.5A power line alignment rules.

**Ordering Information**

Part Number	Temperature	Package	Marking	Moisture Sensitivity Level	Environment Information	Delivery Form
AW86917AFCR	-40°C ~ 85°C	FCQFN 2mmX3mmX0.55mm- 20L	JQUL	MSL1	ROHS+HF	6000 units/ Tape and Reel
AW86917BFCR	-40°C ~ 85°C	FCQFN 2mmX3mmX0.55mm- 20L	JQUL	MSL1	ROHS+HF	6000 units/ Tape and Reel

**Absolute Maximum Ratings**(NOTE 1)

Parameter	Range
Battery Supply Voltage VBAT	-0.3V to 6.0V
Digital power supply VREG	-0.3V to 2.0V
Internal charge pump voltage VCP	-0.3V to 17V
Boost output voltage VBST PVDD	-0.3V to 13V
Internal boost switch pin SW	-0.3V to 15V
HDP, HDN	-0.3V to PVDD+0.3V
Package Thermal Resistance $\theta_{JA}$	60°C/W
Ambient Temperature Range	-40°C to 85°C
Maximum Junction Temperature $T_{JMAX}$	150°C
Storage Temperature Range $T_{STG}$	-65°C to 150°C
Lead Temperature(Soldering 10 Seconds)	260°C
ESD Rating (NOTE 2 3)	
HBM(Human Body Model)	±2KV
CDM(Charge Device Model)	±1.5KV
Latch-up	
Test Condition: JEDEC EIA/JESD78E	+IT: 200mA -IT: -200mA

NOTE 1: Conditions out of those ranges listed in "absolute maximum ratings" may cause permanent damages to the device. In spite of the limits above, functional operation conditions of the device should within the ranges listed in "recommended operating conditions". Exposure to absolute-maximum-rated conditions for prolonged periods may affect device reliability.

NOTE 2: The human body model is a 100pF capacitor discharged through a 1.5kΩ resistor into each pin. Test method: ANSI/ESDA/JEDEC JS-001-2017.

NOTE 3: Charge Device Model test method: JEDEC EIA/JESD22-C101F.

## Electrical Characteristics

### Characteristics

Test condition: TA=25°C, VBAT=4.2V, PVDD=8V, RL=8Ω+100μH(unless otherwise noted)

Symbol	Description	Test Conditions	Min	Typ.	Max	Units

## Detailed Functional Description

### Power On Reset

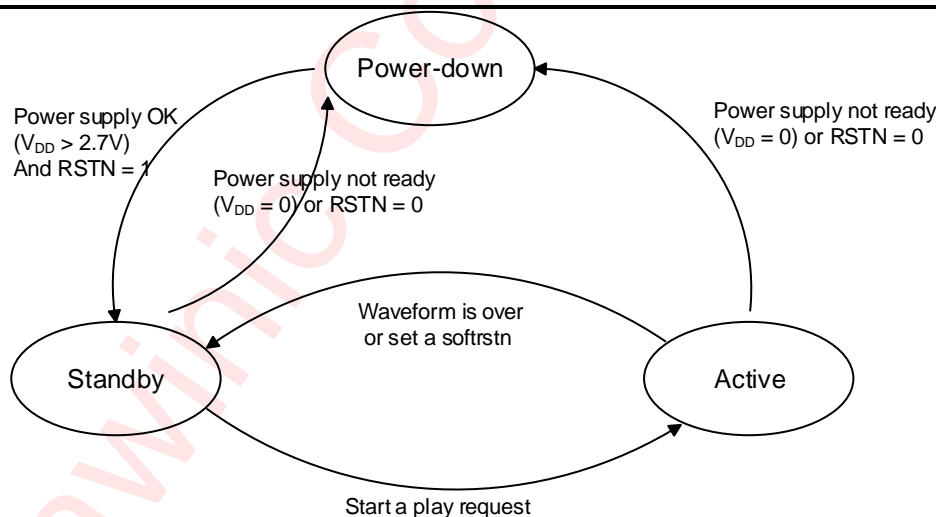

The device provides a power-on reset feature that is controlled by VREG OK. The reset signal will be generated to perform a power-on reset operation, which will reset all circuits and configuration registers. When the VBAT power on, the VREG voltage raises and produce the OK indication, the reset is over.

### Operation Mode

The device supports 3 operation modes.

**Table 1 Operating Mode**

Mode	Condition	Description
Power-Down	VBAT = 0V or RSTN = 0V	Power supply is not ready or RSTN is tie to low.  Whole chip shutdown including I <sup>2</sup> C interface.
Standby	VBAT > 2.7V and RSTN = HIGH and no wave is going	Power supply is ready and RSTN is tie to high.  Most parts of the device are power down for low power consumption except I <sup>2</sup> C interface and LDO.
Active	Playing a waveform	Most parts of the device are working

**Figure 14 Device operating modes transition**

### POWER-DOWN MODE

The device switches to power-down mode when the supply voltage is not ready or RSTN pin is set to low. In this mode, all circuits inside this device will be shut down. I<sup>2</sup>C interface isn't accessible in this mode, and all of the internal configurable registers are cleared.

The device will jump out of the power-down mode automatically when the supply voltages are OK and RSTN pin is set to high.

### Standby Mode

The device switches standby mode when the power supply voltages are OK and RSTN pin set to high. In this mode I<sup>2</sup>C interface is accessible, other modules except LDO module are still powered down. Customer can force device to this mode by setting STANDBY to high. Also in this mode, customer can initialize waveform library in SRAM. Device will be switched to this mode after haptic waveform playback finished.

### Active Mode

The device is fully operational in this mode. Boost and H-bridge driver circuits will start to work. Users can send a playback request to make device in this mode.

### Power On And Power Down Sequence

This device power on sequence is illustrated in the following figure:

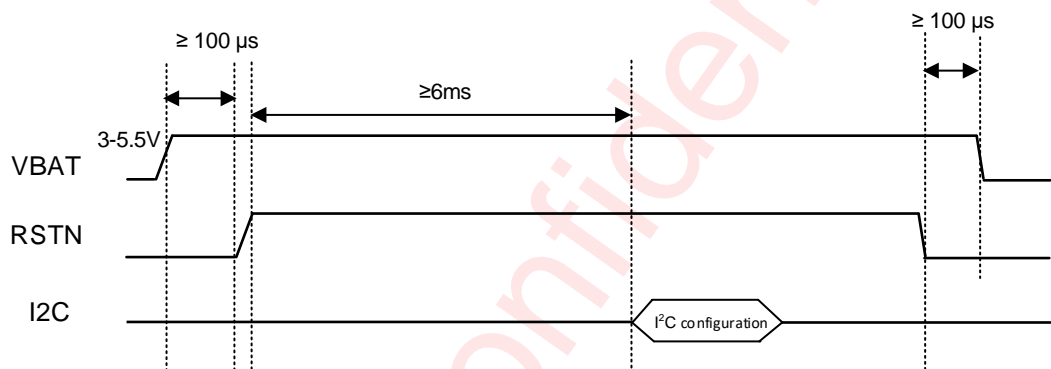

Figure 15 Power On Sequence

### Playback Sequence

Make sure the device is not in POWER-DOWN MODE before sending a playback request, then the playback sequence is illustrated in the following figure:

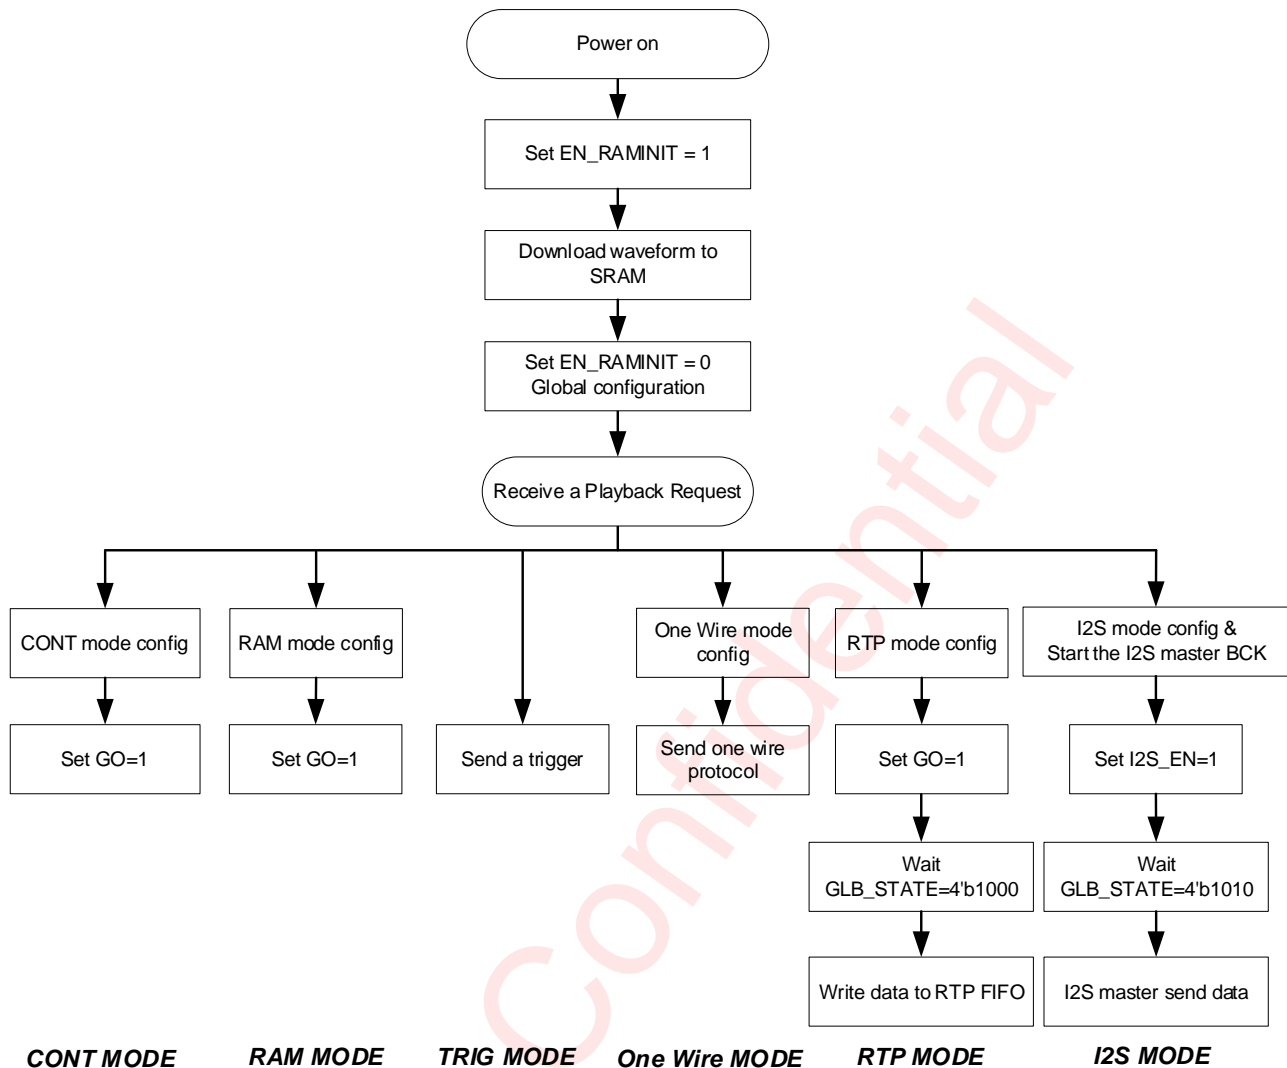

Figure 16 Power up and playback sequence

## Software Reset

Writing 0xAA to register CHIPID(0x00) via I<sup>2</sup>C interface will reset the device internal circuits and all configuration registers.

## Battery Voltage Detect

Software can send command to detect the battery voltage.

### Detect steps:

- Set EN\_RAMINIT to 1 in register 0x43;
- Set VBAT\_GO to 1 in register 0x52;
- Delay 3ms;
- Set EN\_RAMINIT to 0 in register 0x43;
- Read VBAT\_LO in register 0x57 and VBAT in register 0x55. Code= {VBAT, VBAT\_LO}.

The code is a 10bit unsigned number.

$$VBAT = \frac{6.1 \times code}{1024} (V)$$

## Constant Vibration Strength

The device features power-supply feedback. If the supply voltage discharge over time, the vibration strength remains the same as long as enough supply voltage is available to sustain the required output voltage. It is especially useful for ring application.

## LRA Consistency Calibration

Different motor batches, assembly conditions and other factors can result in f<sub>0</sub> deviation of LRA. When the drive waveform does not match the LRA monomer, the vibration may be inconsistent and the braking effect becomes worse, especially for short vibration waveforms. So it's necessary to perform consistency calibration of LRA. Firstly the power-on f<sub>0</sub> detection can be launched to get the f<sub>0</sub> of LRA. Secondly the waveform frequency stored in SRAM and the f<sub>0</sub> of LRA are used to calculate the code for calibration. The f<sub>0</sub> accuracy after LRA consistency calibration is ±2Hz.

## LRA Resistance Detect

Software can send command to detect the LRA's resistance. Based on this information host can diagnosis used LRA's status.

### Detect steps:

- Set EN\_RAMINIT to 1 in register 0x43;
- Set RL\_OS to 1 in register 0x51;
- Set DIAG\_GO to 1 in register 0x52;
- Delay 3ms;
- Set EN\_RAMINIT to 0 in register 0x43;
- Read RL in register 0x53 and RL\_LO in register 0x57. Code= {RL, RL\_LO}.

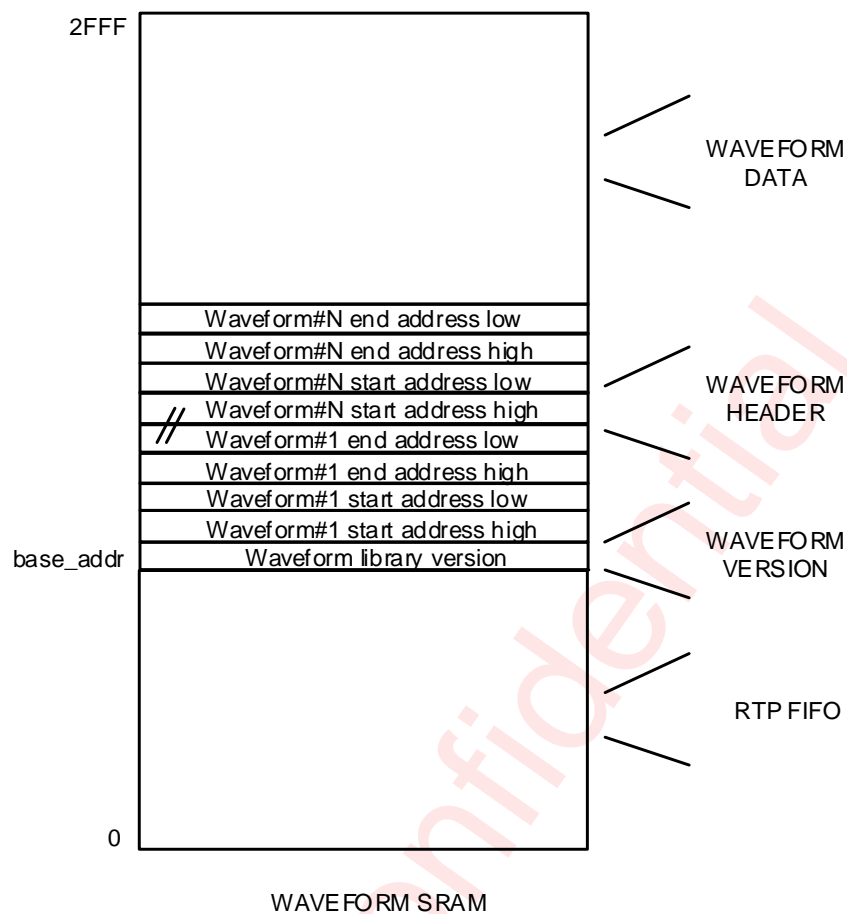

The code is a 10bit unsigned number.

$$RL = \frac{678 \times code}{1024 \times d2s\_gain} (\Omega)$$

## Flexible Haptic Data Playback

The device offers multiple ways to playback haptic effects data. The PLAY\_MODE bits select RAM mode, RTP mode, CONT mode. Additional flexibility is provided by the three hardware TRIG pins, which can override PLAY\_MODE bit to playback haptic effects data as configuration.

The device contains 12 kB of integrated SRAM to store customer haptic waveforms' data. The whole SRAM is separated to RAM waveform library and RTP FIFO region by base address. And RAM waveform library is including waveform library version, waveform header and waveform data.

**Figure 17 Data structure in SRAM**

SRAM mode and TRIG mode playback the waveforms in RAM waveform library and RTP mode playback the waveform data written in RTP FIFO, CONT mode playback non-filtered or filtered square wave with rated drive voltage.

### **Sram Structure**

A RAM waveform library consists of a waveform version byte, a waveform header section, and the waveform data content. The waveform header defines the data boundaries for each waveform ID in the data field, and the waveform data contains a signed data format (2's complement) to specify the magnitude of the drive.

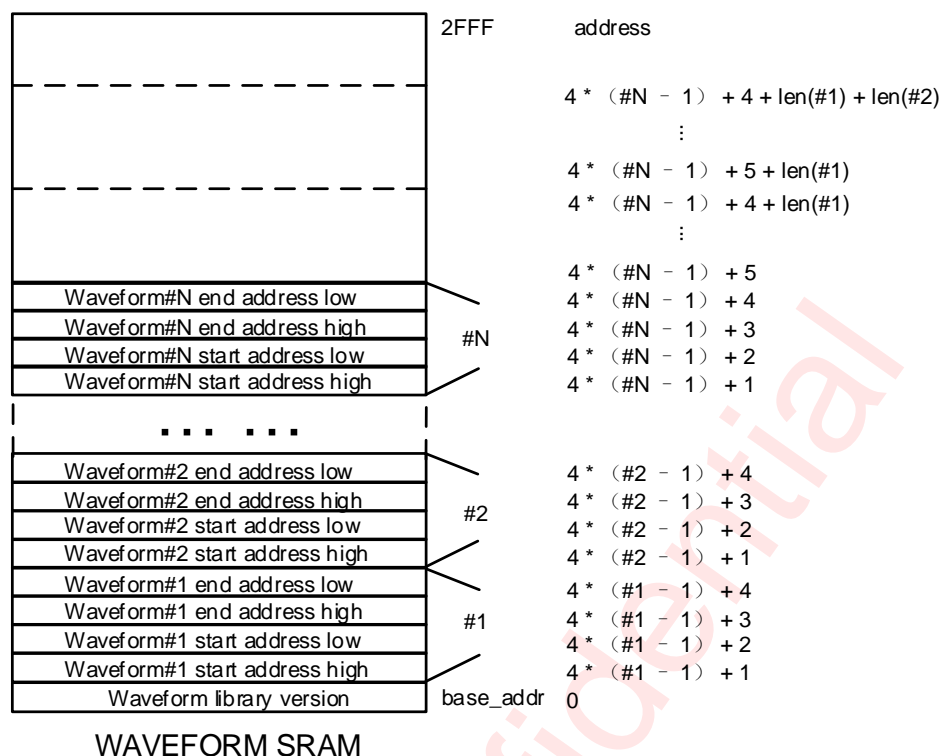

Figure 18 Waveform library data structure

#### Waveform version:

One byte located on SRAM base address, setting to different value to identify different version of RAM waveform library.

#### Waveform header:

The waveform header block consist of N-boundary definition blocks of 4 bytes each. N is the number of waveforms stored in the SRAM (N cannot exceed 127). Each of the boundary definition blocks contain the start address (2 bytes) and end address (2 bytes). So the total length of waveform header block are  $N * 4$  bytes.

The start address contains the location in the memory where the waveform data associated with this waveform begins.

The end address contains the location in the memory where the waveform data associated with this waveform ends.

The waveform ID is determined after base address is defined. Four bytes begins with the address next to base address are the first waveform ID's header, and next four bytes are the second waveform ID's header, and so on.

#### Waveform data:

The waveform data contains a signed data format (2's complement) to specify the magnitude of the drive. The begin address and end address is specified in waveform ID's header.

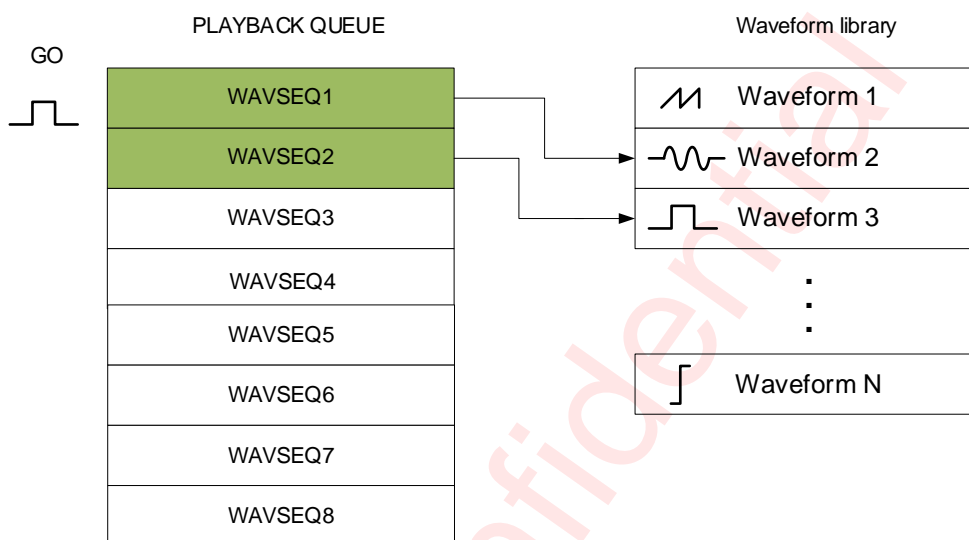

#### Waveform library initialization steps:

- Prepare waveform library data including: waveform library version, waveform header fields for waveform in library and waveform data of each waveform;
- Set register EN\_RAMINIT=1 in register 0x43, to enable SRAM initial;
- Set base address (register 0x2D, 0x2E);

- Write waveform library data into register 0x42 continually until all the waveform library data written;
- Set register EN\_RAMINIT=0, to disable SRAM initial.

### Ram Mode

To playback haptic data with RAM mode, the waveform ID must first be configured into the waveform playback queue and then the waveform can be played by writing GO bit register.

**Figure 19 RAM mode playback**

The waveform playback queue defines waveform IDs in waveform library for playback. Eight WAVSEQx registers queue up to eight library waveforms for sequential playback. A waveform ID is an integer value referring to the index of a waveform in the waveform library. Playback begins at WAVSEQ1 when the user triggers the waveform playback queue. When playback of that waveform ends, the waveform queue plays the next waveform ID held in WAVSEQ2 (if non-zero). The waveform queue continues in this way until the queue reaches an ID value of zero or until all eight IDs are played whichever comes first.

The waveform ID is a 7-bit number. The MSB of each ID register can be used to implement a delay between queue waveforms. When the SEQxWAIT is high, bits 6-0 indicate the length of the wait time. The wait time for that step then becomes  $\text{WAVSEQ}[6:0] \times \text{wait\_time unit}$ . Wait\_time unit can be configuration of WAITSLOT register(in 0x16 register).

The device allows for looping of individual waveforms by using the SEQxLOOP registers. When used, the state machine will loop the particular waveform the number of times specified in the associated SEQxLOOP register before moving to the next waveform. The device allows for looping of the entire playback sequence by using the MAIN\_LOOP register. The waveform-looping feature is useful for long, custom haptic playbacks, such as a haptic ringtone.

### Playback steps:

- Waveform library must be initialized before playback;
- Set PLAY\_MODE bit to 0 in register 0x08;
- Set playback queue registers (0x0A ~ 0x11) as desired;
- Set playback loop registers (0x12~ 0x16) as desired;
- Set GO bit to 1 in register 0x09 to trigger waveform playback;

- Device will be switched to STANDBY mode after haptic waveform playback finished.

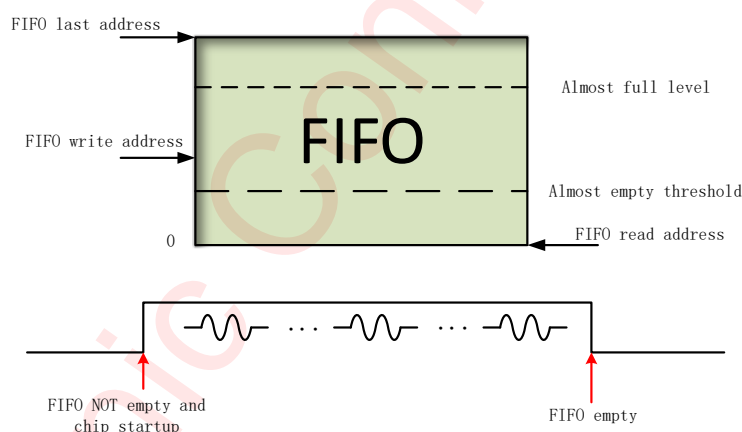

### Rtp Mode

The real-time playback mode is a simple, single 8-bit register interface that holds an amplitude value. When real-time playback is enabled, begin to enters a register value to RTP\_DATA over the I<sup>2</sup>C will trigger the playback, the value is played until the data sending finished or removes the device from RTP mode. The maximum FIFO space is 4Kbyte. During writing data to the RTP\_DATA register, the I2C speed cannot be too low, see the table below for details.

**Table 2 Minimum I2C speed**

WAVDAT_MODE(0x46)	Sample rate of waveform	I2C speed
2'b10/2'b11	12K	≥250KHz
2'b00	24K	≥400KHz
2'b01	48K	1MHz

After FF\_AEM or FF\_AFM register is set to 0, HOST can obtain the RTP FIFO almost empty or almost full status through interrupt signal(pin INTN) or read FF\_AES or FF\_AFS register. RTP FIFO almost empty and almost full threshold can be configured through FIFO\_AE and FIFO\_AF registers.

**Figure 20 RTP mode playback**

### Playback steps:

- Prepare RTP data before playback;
- Set PLAY\_MODE bit to 1 in register 0x08;
- Set GO bit to 1 in register 0x09 to trigger waveform playback;
- Delay 1ms.
- Check GLB\_STATE=4'b1000, if HOST don't send data to FIFO, chip will wait for RTP data coming in this state forever;
- Write RTP data continually to register 0x32 to playback RTP waveform;
- HOST need monitor the full and empty status for RTP FIFO;
- Device will be switched to STANDBY mode after wave data in RTP FIFO is played empty.

**Trig Mode**

The device have three dedicated hardware pins for quickly trigger haptic data playback. Each pin can be configured posedge/negedge/both-edge/level trigger.

**Figure 21 TRIG mode playback**

Edge mode or level mode is accessible by configuring register TRGx\_LEV. When a edge mode is needed, user should set TRGx\_LEV =0. In edge mode, register TRGxSEQ\_P and TRGx\_POS respectively represent the waveform and enable signal of positive edge, where register TRGxSEQ\_N and TRGx\_NEG respectively represent the waveform and enable signal of negative edge.

When a level mode is needed, user should set TRGx\_LEV =1, and positive level and negative level can be supported by setting register TRGX\_POLAR=0 and setting TRGX\_POLAR=1.

**Table 3 TRIG MODE CONFIG**

	I2C reg				Trigger	Waveform
	TRGx_LVL	TRGx_POLAR	TRGx_POS	TRGx_NEG		
0	X	X	0	0	-	none
	X	X	1	0	↑	TRGxSEQ_P
	X	X	0	1	↓	TRGxSEQ_N
	X	X	1	1	↑ / ↓	TRGxSEQ_P / TRGxSEQ_N
1	0	0	X	X	High level	TRGxSEQ_P
	1	1	X	X	Low level	TRGxSEQ_N

**Playback steps:**

- Waveform library must be initialized before playback;
- Set trigger playback registers (0x33 ~ 0x3A) as desired;
- Send trigger pulse (≥1μs) or trigger level (≥1ms) on TRIG pins to playback waveform;
- Device will be switched to STANDBY mode after haptic waveform playback finished.

**One wire Mode**

The function of one wire mode mainly transfer two information : sequence number and gain of waveform, TRIG1 is the interface pin.

**Playback steps:**

- Waveform library must be initialized before playback;
- Set TRG\_ONEWIRE to 1 in register 0x3A to enable one wire mode;
- Set 0x3E = 0x58 to enable one wire the lowest priority of playback;
- Set 0x3C = 0x75, configure this register above this value in order to receive one wire protocol (about 2.5ms which is the minimum waiting time after chip wakeup, default value is 20 $\mu$ s)
- Determine sequence number and gain of waveform which you want to playback;
- Combine sequence number and gain data into a 15 bit transformation data (low 8 bit is gain, high 7 bit is sequence number), the data is sent from the lowest bit;
- Chip will automatically enter standby mode after playing. The interval time between two sending protocol data should be greater than "3ms+time length of waveform".

Figure 22 One wire mode playback

### Cont Mode

The CONT mode mainly performs two functions: F0 detection and real-time resonance-frequency tracking. F0 detection can be launched by setting EN\_F0\_DET=1 and BRK\_EN =1. When set TRACK\_EN=1, real-time resonance-frequency tracking will be launched by tracking the BEMF of actuator constantly. It provides stronger and more consistent vibrations and lower power consumption. If the resonant frequency shifts for any reason, the function tracks the frequency from cycle to cycle. When TRACK\_EN is set to 0, the width of waveform of cont mode is determined by DRV\_WIDTH in register 0x1A.

When the EDGE\_FRE register is set to 4'b1xxx, the CONT mode outputs a filtered square wave. The edge of filtered square wave is composed of SIN or COS wave whose frequency can be configured by EDGE\_FRE register. When SIN\_MODE register is set to 1, filtered square wave is composed of COS wave.

### Playback steps:

- Set PLAY\_MODE = 2 in register 0x08 to enable CONT mode ;
- (optional)Set EN\_F0\_DET = 1 and BRK\_EN =1 to enable F0 detection;
- Set cont mode by configuring registers(0x18~0x20 and 0x22);
- Set GO bit to 1 in register 0x09 to trigger waveform playback;
- Delay 1ms;
- If enable F0 detection, read until GLB\_STATE=0. then get F0 information from registers(0x25~0x28).
- Device will be switched to STANDBY mode after haptic waveform playback finished;

Figure 23 Cont mode playback

**I2S Mode**

Device support I2S interface to playback wave data from I2S master. I2S mode can be used to playback waveform following the music which is playing.

**Playback steps:**

- Set I2S\_PIN =1;
- Set 0x6B = 0x28, to enable fast input IO
- Start BCK from I2S master;
- Set I2S playback registers (0x4A ~ 0x4B) as desired;
- Set I2S\_EN =1;
- Wait GLB\_STATE=4'b1010;
- Send I2S data to device.

**Auto Brake Engine**

An auto-brake engine is integrated into this device. Users can adjust the brake strength by setting D2S\_GAIN in register 0x49. The greater D2S\_GAIN, the greater brake strength and the worse loop stability. Auto-brake engine is disabled when setting BRK\_EN=0 or BRK\_TIME=0.

**To enable Auto-brake engine, there are some points to note:**

- TRGx\_BRK in register 0x39,0x3A should be set to 1 when in TRIG mode;
- Auto-brake engine will not work when BRK\_EN=0 in register 0x08;
- Auto-brake engine will not work when EN\_F0\_DET in register 0x18 is set to 1.
- Auto-brake engine will not work when BRK\_TIME in register 0x21 is set to 0.

Figure 24 Brake loop

## DC-DC Converter

The device integrated peak current mode synchronous PWM Boost as H-bridge power stage supply, significantly increase the output voltage dynamic range. Reduces the size of external components and saves PCB space by using about 1.6 MHz switching frequency. Boost output voltage can be set through the I<sup>2</sup>C register 0x06;

The device synchronous Boost with soft-start function to prevent overshoot current at powering-on; integrated the output protection circuit and self-recovery function; integrated Anti-Ring circuit to reduce EMI in DCM mode; built-in substrate switching shutdown circuit, effectively preventing the input and output leakage current anti-irrigation.

## Protection Mechanisms

### **Over Voltage Protection (OVP)**

The boost circuit has integrated the over voltage protection control loop. When the output voltage PVDD is above the threshold, the boost circuits will stop working, until the voltage of PVDD going down and under the normal fixed working voltage.

### **Over Temperature Protection (OTP)**

The device has automatic temperature protection mechanism which prevents heat damage to the chip. It is triggered when the junction temperature is larger than the preset temperature high threshold (default = 160°C). When it happens, the output stages will be disabled. When the junction temperature drops below the preset temperature low threshold (less than 130°C), the output stages will start to operate normally again

### **Over Current (Short) Protection (OCP)**

The short circuit protection function is triggered when HDP/HDN is short too PVDD/GND or HDP is short to HDN, the output stages will be shut down to prevent damage to itself. When the fault condition is disappeared, the output stages of device will restart.

### **Vbat Under Voltage Lock Out Protection (UVLO)**

The device has a battery monitor that monitors the VBAT level to ensure that is above threshold 2.7V, In the event of a VBAT drop, the device immediately power down the Boost and H-bridge driver and latches the UVLO flag.

### **Drive Data Error Protection (DDEP)**

When haptic data sent to drive LRA is error such as: a DC data or almost DC data, it will cause the LRA heat to brake. The device configurable immediately power down the Boost and H-bridge driver and latched the DDEP flag.

## Digital Audio Interface

Wave data is transferred between the host processor and the device via the Digital Audio Interface. The digital audio interface via 3 dedicated pins:

- BCK
- WCK(only 48K/44.1K is supported)

## ■ DATAI

Two-slot I<sup>2</sup>S are supported in this device. The digital audio Interface on this device is slave only and flexible with data width options, including 16, 20, 24, or 32 bits by configurable registers.

Three modes of I<sup>2</sup>S are supported, including standard I<sup>2</sup>S mode, left-justified mode and right-justified data mode, which can be configured via I2SCFG1.I2SMD. These modes are all MSB-first, with data width programmable via I2SCFG1.I2SFS.

The bit clock BCK is used to sample the data across the digital audio interface. The number of bit-clock pulses in a frame is defined as slot length. Three kind of slot length are supported (16/24/32) via configurable register I2SCFG1.I2SBCK. The frequency of BCK can be calculated according to the following equation:

$$BCK \text{ frequency} = \text{SampleRate} * \text{SlotLength} * \text{SlotNumber}$$

**SampleRate:** Sample rate for this digital audio interface;

**SlotLength:** The length of one audio slot in unit of BCK clock;

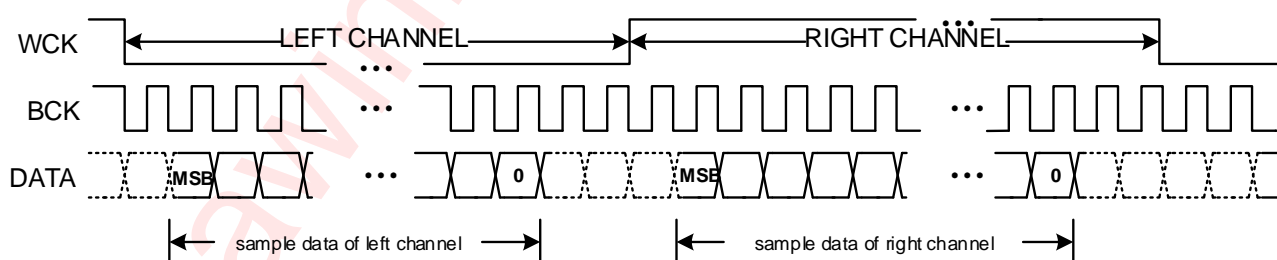

The word select and bit clock signals of the I<sup>2</sup>S input are the reference signals for the digital audio interface and Phased Locked Loop (PLL).

The audio source can be from left channel, right channel or the average of the left and right channel, which is controlled by I2SCFG2.CHSEL.

**Table 4 Supported I2S interface parameters**

Interface format(MSB first)	Data width	BCK frequency
Standard I <sup>2</sup> S	16b 20b/24b/32b	32fs/48fs /64fs 48fs /64fs
left-justified	16b 20b/24b/32b	32fs/48fs /64fs 48fs /64fs
right-justified	16b 20b/24b/32b	32fs /48fs /64fs 48fs /64fs

### Standard I<sup>2</sup>S Mode

**Figure 25 I<sup>2</sup>S Timing for Standard I<sup>2</sup>S Mode**

- When WCK=0 indicating the left channel data, and WCK=1 indicating the right channel data.
- The MSB of the left channel is valid on the second rising edge of the bit clock after the falling edge of the word clock. Similarly the MSB of the right channel is valid on the second rising edge of the bit clock after the rising edge of the word clock.

**Left-Justified Mode****Figure 26 I<sup>2</sup>S Timing for Left-Justified Mode**

- When WCK=1 indicating the left channel data, and WCK=0 indicating the right channel data.
- The MSB of the left channel is valid on the first rising edge of the bit clock after the rising edge of the word clock. Similarly the MSB of the right channel is valid on the first rising edge of the bit clock after the falling edge of the word clock.

**Right-Justified Mode****Figure 27 I<sup>2</sup>S Timing for Right-Justified Mode**

- When WCK is high indicating the left channel data, and WCK=0 indicating the right channel data.
- The LSB (bit 0) of the left channel is valid on the rising edge of the bit clock preceding the falling edge of the word clock. Similarly, the LSB (bit 0) of the right channel is valid on the rising edge of the bit clock preceding the rising edge of the word clock.

**I<sup>2</sup>C Interface**

This device supports the I<sup>2</sup>C serial bus and data transmission protocol in fast mode at 400kHz and fast mode plus at 1000kHz. This device operates as a slave on the I<sup>2</sup>C bus. Connections to the bus are made via the open-drain I/O pins SCL and I pin SDA. The pull-up resistor can be selected in the range of 1k~10kΩ and the typical value is 4.7kΩ. This device can support different high level (1.8V~3.3V) of this I<sup>2</sup>C interface.

**Device Address**

The I<sup>2</sup>C device address (7-bit) can be set using the AD pin according to the following table:

Table 5 Address Selection

AD	I <sup>2</sup> C address (7-bit)
0	0x5A
1	0x5B

**Data Validation**

When SCL is high level, SDA level must be constant. SDA can be changed only when SCL is low level.

Figure 28 Data Validation Diagram

**General I<sup>2</sup>C Operation**

The I<sup>2</sup>C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. The device is addressed by a unique 7-bit address; the same device can send and receive data. In addition, Communications equipment has distinguish master from slave device: In the communication process, only the master device can initiate a transfer and terminate data and generate a corresponding clock signal. The devices using the address access during transmission can be seen as a slave device.

SDA and SCL connect to the power supply through the current source or pull-up resistor. SDA and SCL default is a high level. There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus.

START state: The SCL maintain a high level, SDA from high to low level

STOP state: The SCL maintain a high level, SDA pulled low to high level

Start and Stop states can be only generated by the master device. In addition, if the device does not produce STOP state after the data transmission is completed, instead re-generate a START state (Repeated START, Sr), and it is believed that this bus is still in the process of data transmission. Functionally, Sr state and START state is the same. As shown in Figure 29.

Figure 29 START and STOP state generation process

In the data transmission process, when the clock line SCL maintains a high level, the data line SDA must remain the same. Only when the SCL maintain a low level, the data line SDA can be changed, as shown in Figure 30. Each transmission of information on the SDA is 9 bits as a unit. The first eight bits are the data to be transmitted, and the first one is the most significant bit (Most Significant Bit, MSB), the ninth bit is an confirmation bit (Acknowledge, ACK or A), as shown in Figure 31. When the SDA transmits a low level in ninth clock pulse, it means the acknowledgment bit is 1, namely the current transmission of 8 bits data are confirmed,

otherwise it means that the data transmission has not been confirmed. Any amount of data can be transferred between START and STOP state.

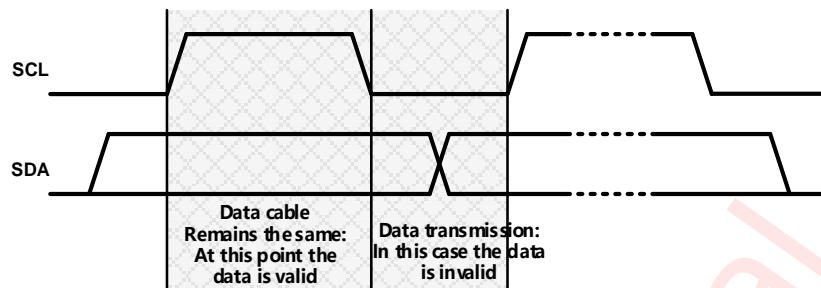

Figure 30 The data transfer rules on the I<sup>2</sup>C bus

The whole process of actual data transmission is shown in Figure 31. When generating a START condition, the master device sends an 8-bit data, including a 7-bit slave addresses (Slave Address), and followed by a "read / write" flag ( $\overline{R/W}$ ). The flag is used to specify the direction of transmission of subsequent data. The master device will produce the STOP state to end the process after the data transmission is completed. However, if the master device intends to continue data transmission, you can directly send a Repeated START state, without the need to use the STOP state to end transmission.

Figure 31 Data transmission on the I<sup>2</sup>C bus

### Write Process

Writing process refers to the master device write data into the slave device. In this process, the transfer direction of the data is always unchanged from the master device to the slave device. All acknowledge bits are transferred by the slave device, in particular, the device as the slave device, the transmission process in accordance with the following steps, as shown in Figure 32:

Master device generates START state. The START state is produced by pulling the data line SDA to a low level when the clock SCL signal is a high level.

Master device transmits the 7-bits device address of the slave device, followed by the "read / write" flag (flag  $\overline{R/W} = 0$ );

The slave device asserts an acknowledgment bit (ACK) to confirm whether the device address is correct;

The master device transmits the 8-bit register address to which the first data byte will written;

The slave device asserts an acknowledgment (ACK) bit to confirm the register address is correct;

Master sends 8 bits of data to register which needs to be written;

The slave device asserts an acknowledgment bit (ACK) to confirm whether the data is sent successfully;

If the master device needs to continue transmitting data by sending another pair of data bytes, just need to repeat the sequence from step 6. In the latter case, the targeted register address will have been auto-incremented by the device.

The master device generates the STOP state to end the data transmission.

Figure 32 Writing process (data transmission direction remains the same)

### Read Process

Reading process refers to the slave device reading data back to the master device. In this process, the direction of data transmission will change. Before and after the change, the master device sends START state and slave address twice, and sends the opposite "read/write" flag. In particular, AW86917A/B as the slave device, the transmission process carried out by following steps listed in Figure 33:

Master device asserts a start condition;

Master device transmits the 7 bits address of the device, and followed by a "read / write" flag ( $R/\bar{W} = 0$ );

The slave device asserts an acknowledgment bit (ACK) to confirm whether the device address is correct;

The master device transmits the register address to make sure where the first data byte will read;

The slave device asserts an acknowledgment (ACK) bit to confirm whether the register address is correct or not;

The master device restarts the data transfer process by continuously generating STOP state and START state or a separate Repeated START;

Master sends 7-bits address of the slave device and followed by a read / write flag (flag  $R/\bar{W} = 1$ ) again;

The slave device asserts an acknowledgment (ACK) bit to confirm whether the register address is correct or not;

Master transmits 8 bits of data to register which needs to be read;

The slave device sends an acknowledgment bit (ACK) to confirm whether the data is sent successfully;

The device automatically increment register address once after sent each acknowledge bit (ACK),

The master device generates the STOP state to end the data transmission.

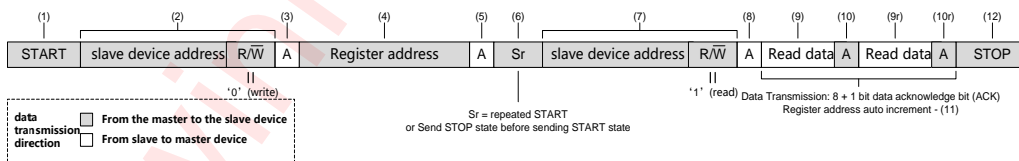

Figure 33 Reading process (data transmission direction remains the same)

## Register Detailed Description

Note: Reserved register should not be written

SRST: (Address 00h)				
Bit	Symbol	R/W	Description	Default
7:0	CHIPID	RO	All configuration registers will be reset to default value after 0xaa is written	0x06

SYSST: (Address 01h)				
Bit	Symbol	R/W	Description	Default
7:6	Reserved	RO	Not used	0
5	UVLS	RO	1: VBAT voltage is under UV voltage (2.7V)	0
4	FF_AES	RO	1: RTP FIFO is almost empty	0
3	FF_AFS	RO	1: RTP FIFO is almost full	0
2	OCDS	RO	1: Over Current status	0
1	OTS	RO	1: Over Temperature status	0
0	DONES	RO	1: The indication of playback finished	0

SYSINT: (Address 02h)				
Bit	Symbol	R/W	Description	Default
7:6	Reserved	RC	Not used	0
5	UVLI	RC	When UVLI=1, it means UVLS has been 1 at least once since the last read	0
4	FF_AEI	RC	When FF_AEI=1, it means FF_AES has been 1 at least once since the last read	0
3	FF_AFI	RC	When FF_AFI=1, it means FF_AFS has been 1 at least once since the last read	0
2	OCDI	RC	When OCDI=1, it means OCDS has been 1 at least once since the last read	0
1	OTI	RC	When OTI=1, it means OTS has been 1 at least once since the last read	0
0	DONEI	RC	When DONEI=1, it means DONES has been 1 at least once since the last read	0

SYSINTM: (Address 03h)				
Bit	Symbol	R/W	Description	Default
7:6	Reserved	RW	Not used	3
5	UVLM	RW	Interrupt mask for UVLI: 0: INTN pin will be pulled down when UVLI=1 1: INTN pin will not be pulled down when UVLI=1	1

4	FF_AEM	RW	Interrupt mask for FF_AEI: 0: INTN pin will be pulled down when FF_AEI=1 1: INTN pin will not be pulled down when FF_AEI=1	1
3	FF_AFM	RW	Interrupt mask for FF_AFI: 0: INTN pin will be pulled down when FF_AFI=1 1: INTN pin will not be pulled down when FF_AFI=1	1
2	OCDM	RW	Interrupt mask for OCDI: 0: INTN pin will be pulled down when OCDI=1 1: INTN pin will not be pulled down when OCDI=1	1
1	OTM	RW	Interrupt mask for OTI: 0: INTN pin will be pulled down when OTI=1 1: INTN pin will not be pulled down when OTI=1	1
0	DONEM	RW	Interrupt mask for DONEI: 0: INTN pin will be pulled down when DONEI=1 1: INTN pin will not be pulled down when DONEI=1	1

PLAYCFG1: (Address 06h)				
Bit	Symbol	R/W	Description	Default
7	Reserved	RW	Not used	0
6	BST_MODE	RW	BOOST mode 0:bypass mode 1:boost mode	0
5:0	BST_VOUT_RDA	RW	PVDD voltage setup:default=100000, $\Delta V=78.893mV$ 000000:6V 000001:6V+ $\Delta V$ 000010:6V+ $\Delta V*2$ 000011:6V+ $\Delta V*3$ ..... 111111:6+ $\Delta V*63$	0x20

PLAYCFG2: (Address 07h)				
Bit	Symbol	R/W	Description	Default
7:0	GAIN	RW	gain setting for waveform data, it is a global setting for all waveform data(expect CONT).GAIN=code/128	0x80

PLAYCFG3: (Address 08h)				
Bit	Symbol	R/W	Description	Default
7	Reserved	RW	Not used	0
6	AUTO_BST	RW	1: disable boost when data is 0 in rtp and i2s mode	1
5	STOP_MODE	RW	0 : stop when current wave is over 1: stop right now	0
4:3	Reserved	RW	Not used	0
2	BRK_EN	RW	when set 1, enable auto brake after RTP/RAM/CONT/I2S playback mode is stopped	1
1:0	PLAY_MODE	RW	waveform play mode for GO trig b00: RAM mode b01: RTP mode b10: CONT mode b11: no play	0

PLAYCFG4: (Address 09h)				
Bit	Symbol	R/W	Description	Default
7:2	Reserved	RW	Not used	0
1	STOP	RW	when set 1, stop the current playback mode	0
0	GO	RW	RAM/RTP/CONT mode playback trig bit when set to 1, chip will playback one of the play mode.	0

WAVCFG1: (Address 0Ah)				
Bit	Symbol	R/W	Description	Default
7	SEQ1WAIT	RW	When set to 1, WAVSEQ1 means wait time, else means wave sequence number	0
6:0	WAVSEQ1	RW	Wait time (code*WAITSLOT) or wave sequence number	1

WAVCFG2: (Address 0Bh)				
Bit	Symbol	R/W	Description	Default
7	SEQ2WAIT	RW	When set to 1, WAVSEQ2 means wait time, else means wave sequence number	0
6:0	WAVSEQ2	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG3: (Address 0Ch)				
Bit	Symbol	R/W	Description	Default
7	SEQ3WAIT	RW	When set to 1, WAVSEQ3 means wait time, else means wave sequence number	0
6:0	WAVSEQ3	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG4: (Address 0Dh)				
Bit	Symbol	R/W	Description	Default
7	SEQ4WAIT	RW	When set to 1, WAVSEQ4 means wait time, else means wave sequence number	0
6:0	WAVSEQ4	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG5: (Address 0Eh)				
Bit	Symbol	R/W	Description	Default
7	SEQ5WAIT	RW	when set to 1, WAVSEQ5 means wait time, else means wave sequence number	0
6:0	WAVSEQ5	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG6: (Address 0Fh)				
Bit	Symbol	R/W	Description	Default
7	SEQ6WAIT	RW	When set to 1, WAVSEQ6 means wait time, else means wave sequence number	0
6:0	WAVSEQ6	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG7: (Address 10h)				
Bit	Symbol	R/W	Description	Default
7	SEQ7WAIT	RW	when set to 1, WAVSEQ7 means wait time, else means wave sequence number	0
6:0	WAVSEQ7	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG8: (Address 11h)				
Bit	Symbol	R/W	Description	Default
7	SEQ8WAIT	RW	When set to 1, WAVSEQ8 means wait time, else means wave sequence number	0
6:0	WAVSEQ8	RW	Wait time (code*WAITSLOT) or wave sequence number	0

WAVCFG9: (Address 12h)				
Bit	Symbol	R/W	Description	Default
7:4	SEQ1LOOP	RW	control the loop number of the first sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ1LOOP $\neq$ 0xF	0
3:0	SEQ2LOOP	RW	control the loop number of the second sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ2LOOP $\neq$ 0xF	0

WAVCFG10: (Address 13h)				
Bit	Symbol	R/W	Description	Default

7:4	SEQ3LOOP	RW	control the loop number of the third sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ3LOOP $\neq$ 0xF	0
3:0	SEQ4LOOP	RW	control the loop number of the fourth sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ4LOOP $\neq$ 0xF	0

WAVCFG11: (Address 14h)				
Bit	Symbol	R/W	Description	Default
7:4	SEQ5LOOP	RW	control the loop number of the fifth sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ5LOOP $\neq$ 0xF	0
3:0	SEQ6LOOP	RW	control the loop number of the sixth sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ6LOOP $\neq$ 0xF	0

WAVCFG12: (Address 15h)				
Bit	Symbol	R/W	Description	Default
7:4	SEQ7LOOP	RW	control the loop number of the seventh sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ7LOOP $\neq$ 0xF	0
3:0	SEQ8LOOP	RW	control the loop number of the eighth sequence b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or SEQ8LOOP $\neq$ 0xF	0

WAVCFG13: (Address 16h)				
Bit	Symbol	R/W	Description	Default
7	Reserved	RW	Not used	0
6:5	WAITSLLOT	RW	unit of wait time b00: (1/WAVDAT_MODE) s b01: (8/WAVDAT_MODE) s b10: (64/WAVDAT_MODE) s b11: (512/WAVDAT_MODE) s	0
4	Reserved	RW	Not used	0
3:0	MAINLOOP	RW	control the main loop number b0000~b1110: play (code+1) time b1111: playback infinitely until STOP set to 1 or MAINLOOP $\neq$ 0xF	0

CONTCFG1: (Address 18h)				
Bit	Symbol	R/W	Description	Default
7:4	EDGE_FRE	RW	define the edge frequency 1000 : 200Hz 1001 : 300Hz 1010 : 400Hz 1011 : 500Hz 1100 : 600Hz 1101 : 700Hz 1110 : 800Hz 1111 : 900Hz OXXX : no edge control	13
3	EN_F0_DET	RW	f0 detection mode enable 1: enable 0: disable	0

2	Reserved	RW	Not used	0
1	BRK_BST_MD	RW	when set 1, brake is the same with current playback mode (boost or bypass) otherwise brake is bypass mode	0
0	SIN_MODE	RW	edge mode 1: cos 0: sine	1

CONTCFG2: (Address 19h)				
Bit	Symbol	R/W	Description	Default
7:0	F_PRE	RW	set the value of F0, $F0=(24K/code)Hz$	0x8D

CONTCFG3: (Address 1Ah)				
Bit	Symbol	R/W	Description	Default
7:0	DRV_WIDTH	RW	Half cycle drive time of brake and it is also the half cycle drive time of drive when TRACK_EN=0, this value must be smaller than half cycle time of F0. Time = code/48000 (s)	0x6A

## Application Information

### Inductor Selection Guideline

Selecting inductor needs to consider Inductance, size, magnetic shielding, saturation current and temperature current.

#### a) Inductance

Inductance value is limited by the boost converter's internal loop compensation. In order to ensure phase margin sufficient under all operating conditions, recommended 1μH inductor.

#### b) Size

For a certain value of inductor, the smaller the size, the greater the parasitic series resistance of the inductor DCR, the higher the loss, corresponds to the lower efficiency.

#### c) Magnetic shielding

Magnetic shielding can effectively prevent the inductance of the electromagnetic radiation interference. It is much better to choose inductance with magnetic shielding in the application of EMI sensitive environment.

#### d) Saturation current and temperature rise of current

Inductor saturation current and temperature rise current value are important basis for selecting the inductor. As the inductor current increases, on the one hand, since the magnetic core begins to saturate, inductance value will decline; on the other hand, the inductor's parasitic resistance inductance and magnetic core loss can lead to temperature rise. In general, the current value is defined as the saturation current  $I_{SAT}$  when the inductance value drops to 70%; the current value is defined as temperature rise current  $I_{RMS}$  when inductance temperature rise 40°C.

For particular applications, need to calculate the maximum  $I_{L\_PEAK}$  and  $I_{L\_RMS}$ , which is a basis of selecting the inductor. When  $V_{BAT}=3.8V$ ,  $PVDD=8.5V$ ,  $R_L = 8\Omega$ , Output drive  $R_{DSON} = 300m\Omega$ , when the maximum power without distortion, the output power is calculated as follows:

$$P_{OUT} = \frac{(V_{OUT} \times \frac{R_L}{R_L + R_{DSON}})^2}{2 \times R_L \times (1 - 2.3\%)} = \frac{(8.5 \times \frac{8}{8 + 0.3})^2}{2 \times 8 \times 0.977} W = 4.294W$$

Where the coefficients in the denominator of (0.977) is the power ratio of no truncation maximum output. In such a large output power, the overall efficiency of the output drive is typically 75%, in order to calculate the maximum average current  $I_{MAX\_AVG\_VBAT}$  and maximum peak current  $I_{MAX\_PEAK\_VBAT}$  drawn from  $V_{BAT}$ :

$$I_{MAX\_AVG\_VBAT} = \frac{P_{OUT}}{V_{BAT} \times \eta} = \frac{4.294}{3.8 \times 0.75} A = 1.507A$$

$$I_{MAX\_PEAK\_VBAT} = 2 \times I_{MAX\_AVG\_VBAT} = 2 \times 1.507A = 3.014A$$

If inductor DCR is 50mΩ, then when the output power of 4.294W, the inductor power loss is:

$$P_{DCR\_LOSS} = 1.5 \times I_{MAX\_AVG\_VBAT}^2 \times DCR = 1.5 \times 1.507^2 \times 0.05 W = 170.3 mW$$

Wherein the coefficient 1.5 is the square of the ratio of the sine wave current RMS value and average value (there is no consideration of the impact of the inductor ripple, the actual DCR loss will be even greater). If the loss which is resulting from DCR is less than 1% at efficiency ( $P_{OUT} = 4.294W$ ,  $\eta = 75\%$ ), then:

$$DCR = \frac{P_{DCR\_LOSS}}{1.5 \times I_{MAX\_AVG\_VBAT}^2} \leq 0.01 \times \frac{P_{OUT}}{1.5 \times I_{MAX\_AVG\_VBAT}^2 \times \eta} = \frac{0.01 \times 4.294}{1.5 \times 1.507^2 \times 0.75} \Omega = 16.8 m\Omega$$

According to the working principle of the Boost, we can calculate the size of the inductor current ripple  $\Delta I_L$ :

$$\Delta I_L = \frac{V_{BAT} \times (PVDD - V_{BAT})}{PVDD \times f \times L} = \frac{3.8 \times (8.5 - 3.8)}{8.5 \times 1.6 \times 1} A = 1.31A$$

Thus, the maximum peak inductor current  $I_{L\_PEAK}$  and maximum effective inductor current  $I_{L\_RMS}$  is:

$$I_{L\_PEAK} = I_{MAX\_PEAK\_VBAT} + \frac{\Delta I_L}{2} = 3.014 + \frac{1.31}{2} A = 3.669A$$

$$I_{L\_RMS} = \sqrt{I_{MAX\_PEAK\_VBAT}^2 + \frac{\Delta I_L^2}{12}} = \sqrt{3.014^2 + \frac{1.31^2}{12}} A = 3.038A$$

From the above calculation results:

- 1) For typical DCR about 50mΩ inductance, the efficiency loss caused by around 3%;
- 2) Need to choose AW86917A/B inductance input current limit value  $I_{LIMIT}$  is greater than  $I_{L\_PEAK} = 3.6A$  ( $I_{LIMIT} = 4.2A$ ), to guarantee the output drive power can be achieved when THD = 1% (= 4.1W) but not limited by value  $I_{LIMIT}$ ; If you choose  $I_{SAT}$  or  $I_{RMS}$  of the inductance is too small, it is possible to cause the chip don't work properly, or the temperature of the inductance is too high.
- 3) In practice, the maximum output power of the drive is likely to reach 4.3W in an instant, so the selected inductor saturation current  $I_{SAT}$  requires more than the maximum inductor peak current  $I_{L\_PEAK}$ , and cannot be less than 3.6A;
- 4) In some cases, if the  $I_{L\_PEAK}$  calculated according to the above method is greater than the set of input inductor current limit value  $I_{LIMIT}$ , shows the output drive is restricted by inductance input current limit, the actual maximum output power is less than the calculated value, the measured value shall prevail, and  $I_{SAT}$  need greater than the set current limiting value  $I_{LIMIT}$ , and cannot be less than 3.6A;
- 5) Take PVDD = 8.5V for example, under different conditions, the typical method of selecting  $I_{SAT}$  in the following table:

VBAT (V)	PVDD (V)	RL (Ω)	IL_PEAK (A)	Inductor saturation current $I_{SAT}$ minimum value (A)
3.8	8.5	8	3.7	4.2
3.8	8.5	16	2.3	2.5

## Capacitors Selection

### Boost Capacitor Selection

Boost output capacitor is usually within the range 0.1μF~47μF. It needs to use Class II type (EIA) multilayer ceramic capacitors (MLCC). Its internal dielectric is ferroelectric material (typically BaTiO<sub>3</sub>), a high the dielectric constant in order to achieve smaller size, but at the same Class II type (EIA) multilayer ceramic capacitors has poor temperature stability and voltage stability as compared to the Class I type (EIA) capacitance. Capacitor is selected based on the requirements of temperature stability and voltage stability, considering the capacitance material, capacitor voltage, and capacitor size and capacitance values.

#### A) temperature stability

Class II capacitance have different temperature stability in different materials, usually choose X5R type in order to ensure enough temperature stability, and X7R type capacitance has better properties, the price is relatively more expensive; X5R capacitance change within ± 15% in temperature range of -55°C to 85°C, X7R capacitance change within ±15% in temperature range of -55°C~125°C. The Boost output capacitance of AW86917A/B recommends X5R ceramic capacitors.

#### B) Voltage Stability

Class II type capacitor has poor voltage stability Capacitance values falling fast along with the DC bias voltage applied across the capacitor increasing. The rate of decline is related to capacitance material, capacitors rated voltage, capacitance volume. Take for TDK C series X5R for example, its pressure voltage value is 16V or 25V; the package size is 0805, 1206 or 0603, the capacitance value is 10μF. The capacitor's voltage stability of different types of capacitor is as shown below:

Figure 34 Different types of capacitive voltage stability

Among them, the space remaining value of different types of capacitors at V<sub>DC</sub> = 8.5 V as shown in the Figure 35:

Figure 35 The space remaining value of different types of capacitors at V<sub>DC</sub> = 8.5 V

It can be found that the rate of capacitance capacity value descent becomes slow along with "large capacitor size, capacitance pressure voltage rise". The larger the package size, the better voltage stability. The higher the height, the better voltage stability with the same length and width of the capacitance. Voltage stability of smaller package size (0603) capacitor change affected by the pressure value is very small.

In AW86917A/B typical applications, it is necessary to ensure the output value of the Boost capacitor  $\geq 5\mu\text{F}$  when  $\text{PVDD}=8.5\text{V}$ .

### Supply Decoupling Capacitor ( $C_s$ )

The device is a high voltage driver that requires adequate power supply decoupling. Place a low equivalent-series-resistance (ESR) ceramic capacitor, typically  $0.1\mu\text{F}$ . This choice of capacitor and placement helps with higher frequency transients, spikes, or digital hash on the line. Additionally, placing this decoupling capacitor close to the device is important, as any parasitic resistance or inductance between the device and the capacitor causes efficiency loss. In addition to the  $0.1\mu\text{F}$  ceramic capacitor, place a  $10\mu\text{F}$  capacitor on the VBAT supply trace. This larger capacitor acts as a charge reservoir, providing energy faster than the board supply, thus helping to prevent any droop in the supply voltage.

### Output beads, capacitors

The device output is a square wave signal, which causing switch current at the output capacitor, increasing static power consumption, and therefore output capacitor should not be too large,  $0.1\text{nF}$  ceramic capacitors is recommended.

**Figure 36 Ferrite Chip Bead and capacitor**

The device output is a square wave signal. The voltage across the capacitor will be much larger than the  $\text{PVDD}$  voltage after increasing the bead capacitor. It suggested the use of rated voltage above  $16\text{V}$  capacitor. At the same time a square wave signal at the output capacitor switching current form, the static power consumption increases, so the output capacitance should not be too much which is recommended  $0.1\text{nF}$  ceramic capacitor rated voltage of  $16\text{V}$ .

## PCB Layout Consideration

### Layout Considerations

This device is a high voltage driver chip. To obtain the optimal performance, PCB layout should be considered carefully. The suggested Layout is illustrated in the following diagram:

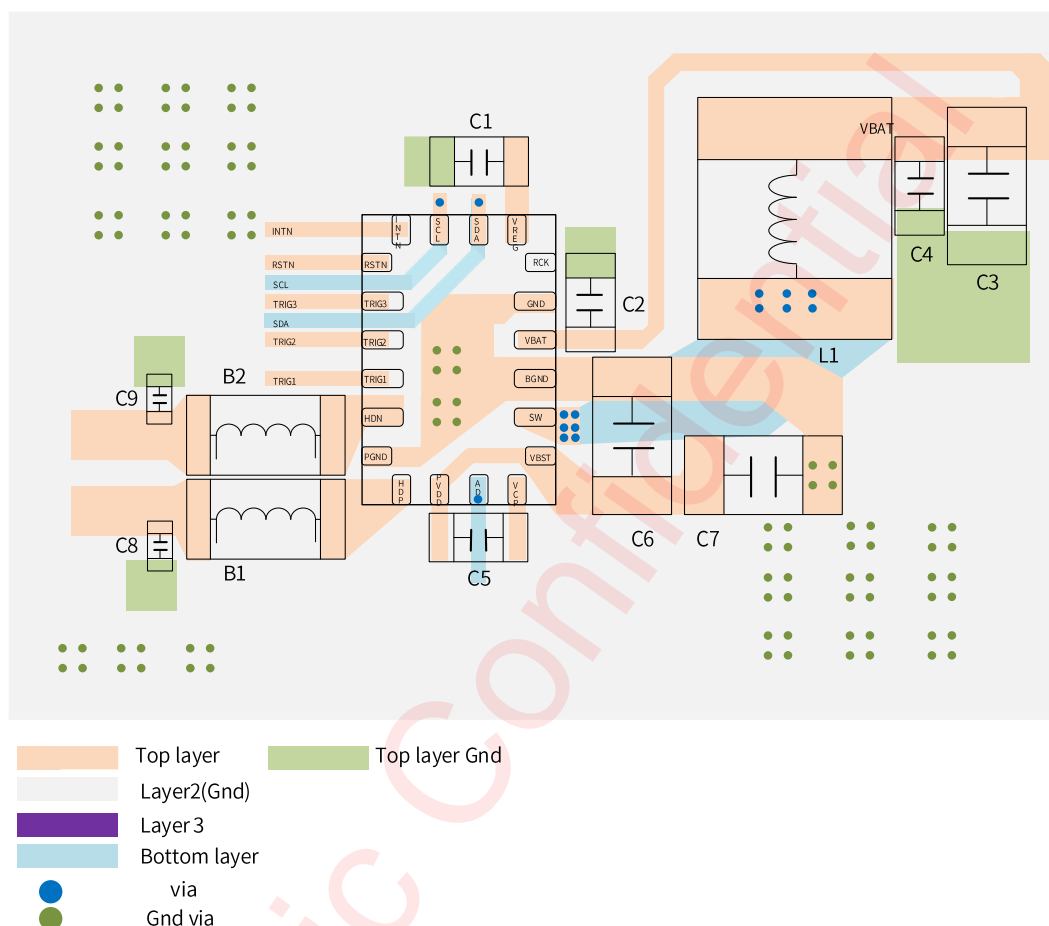

Figure 37 AW86917A/B Board Layout

Here are some guidelines:

1. All of the external components should be placed as close as possible to IC in top layer PCB.
2. SCL and SDA should be shield by ground.
3. The overcurrent capability of the VBAT to SW should meet  $I_{MAX\_PEAK\_VBAT}$ , and C2, C3, C4 should be placed close to IC and L1.
4. C6 and C7 are within 1.5mm to pin PVDD or pin VBST, and the overcurrent capability of the VBST and PVDD traces must be meet  $\frac{PVDD}{R_L+R_{DS(ON)}}$ , and the GND side of the PVDD capacitor should be directly connected to surface layer ground or punched to the main ground of the PCB. In addition, create solid GND plane near and around the IC, connect BGND, PGND and GND together, and the overcurrent capability of the vias should be designed according to the PVDD overcurrent capability.
5. Routing overcurrent capability of HDP/HDN output to the load should meet  $\frac{PVDD}{R_L+R_{DS(ON)}}$ . HDP and HDN should be shield by ground and far away from the interference source especially the FLY capacitor of the high-power charging IC, otherwise it will cause the abnormal F0 detection.

### Tape And Reel Information

#### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

#### DIMENSIONS AND PIN1 ORIENTATION

D1 (mm)	D0 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P0 (mm)	P1 (mm)	P2 (mm)	W (mm)	Pin1 Quadrant
330	12.4	2.3	3.3	0.75	2	4	4	12	Q1

All dimensions are nominal

Unit: mm

## Revision History

Version	Date	Change Record
V1.0	October 2020	Official Version
V1.1	March 2021	Add IQ vs VBAT and delete LRA res vs temp Add timing requirement of trigger pulse Modify TRIG1/2/3 and INTN PIN description Add BST_BRK_GAIN register Revise RL calculation formula
V1.2	April 2021	Revise CHIPID in 0x00 register Add one wire playback steps Add GAIN_BYPASS register Add auto-brake restriction
V1.3	May 2021	Revise PIN RCK description
V1.4	September 2021	Revise PIN description Revise playback mode description Add RL and VBAT detection steps Revise register description Add BRK_BST_MD and START_DLY register Modify PCB Layout Consideration Revise Inductor Selection Guideline
V1.5	March 2022	Revise C6/C7 of Typical Application Circuit Add minimum I2C speed of rtp mode data transmission Add WAKE/STANDBY register Add F <sub>PWM</sub> and revise Ton1/Ton2 in Electrical Characteristics Revise PCB Layout
